MORE THAN 3,000 HOSPITALS USE BAXTER'S INTRAVENOUS SOLUTIONS IN VACOLITERS BECAUSE THEY FIND THEM

UNIFORM • SAFE • ECONOMICAL

PROVED

Before a single litre of Baxter's solutions was sold to the profession generally, there was a history of five years of research, two years of development, then three years of successful clinical use by a selected group of hospitals

We could not afford to "guess"—nor can you. Baxter's solutions in Vacoliters are always sterile, ready to use and instantly available. We have been able to prove to many hospitals that they bring the advantages of safety and improved service at reduced cost

Full details from sole distributors

(12 LINES)

TESTED

Solutions in Vacoliter dispensers are prepared from a fractionated protein-free water. Their pH value is always consistent with their concentration. Baxter solutions are stable and sealed in vacuum and sterilized under recorded control. Each time a new solution is made up it is biologically tested. We ask you to give them a thorough clinical test. What you find out for yourself will be more eloquent than any claims we could possibly make.

Vacoliter
ONE LITER (1000 C.C.) PACKED IN VACUUM

No More Tired Feet or Weak Insteps!

SALMON ODY Spiral Spring ARCH SUPPORTS

have solved the problem in a scientific way. Years of research and experiment were necessary before this wonderful discovery was made.

The Salmon Ody Arch Supports put a spring into the walk, gradually removing the cause of tired feet and strengthening the weak instep.

Perfect comfort, ease of movement, absolute freedom, and relief from all pain are the direct result.

Amazingly Light Easily adjustable
Far better than rigid plates

Most of our clients are sent to us by their medical advisers.

SALTAIR SURGICAL SERVICE

Guarantee

"We guarantee to alter
exchange or accept the
return of any appliance
without cost ordered by
the Medical Profession,
if not found suitable
within fourteen days
from date of supply"

Salt and Son Ltd.

1793 1937
DURING
EIGHT
REIGNS

Founded in the year 1793, in the reign of George III, the House of Salt has a history of continuous Progress during eight reigns. Constantly under the personal supervision of members of the same family, the SALTAIR SURGICAL SERVICE has worked in close co-operation with the medical profession. During nearly a century and a half of unceasing activity, many revolutionary changes and improvements have been effected in the designs of the wide range of Surgical Appliances produced by SALTS while the confidence of medical men has been treasured by the firm and still further encouraged by the unswerving Guarantee which appears at the head of every announcement issued on behalf of this House of Salt which have been strictly confined to the medical press.

And now in this present momentous year, in the early months of a new reign,
SALTS confidently look forward to the future and pledge themselves
to maintain both the Quality of their products and the standard of service.

WAM 3

for ACIDOSIS

ALKA-ZANE is a new therapeutic measure for a newly discovered complication of disease—acidosis. Alka-Zane is not merely a combination of alkalis, but a product resulting from the careful study of the alkali needs of the organism in disease—in pregnancy, in conditions where acidosis needs to be prevented or corrected.

Alka-Zane is a granular, effervescent combination of sodium, potassium, calcium and magnesium citrates, carbonates and phosphates. It contains no sulphates, lactates or tartrates and no sodium chloride. It is efficient and palatable. Alka-Zane means alkali therapy at its best.

EFFICIENCY ESTABLISHED BY BIOLOGICAL TESTS AND CLINICAL USE.

AN EXTRACT OF ADRENAL CORTEX FOR THE TREATMENT OF ADDISON'S DISEASE

AND OTHER CONDITIONS

EUCORTONE is an extract of adrenal cortex, containing the hormone cortin. It is highly successful in Addison's disease. Particularly striking is its rapid restoration of appetite, weight, strength, and feeling of well being.

Successes have now been reported from the use of adrenal cortical extract in various other conditions, including neurasthenia, psoriasis, and hyperemesis gravidarum.

IN ACUTE TOXÆMIA OF BURNS—*Lancet* 1936 June 20th, p. 1400

Three cases of acute toxæmia from burns were treated with EUCORTONE and recovered. In two of the cases death within a short time could have been predicted almost certainly. In the investigators' experience of these conditions, recovery under any methods of treatment previously used had not occurred. The investigators attributed the recovery in these cases with every confidence to EUCORTONE.

EUCORTONE is biologically standardized on adrenalectomized animals. It has now been further purified and concentrated. It is practically free from nitrogen and adrenaline contains no irritant or toxic substance, and is sterile. One c.c.m. of the extract is equivalent to 75 grams of adrenal cortex or about 110 grams of the whole gland. EUCORTONE is administered intra-muscularly intravenously (in crises) and subcutaneously (in chronic cases).

IODATOL, 40 PER CENT.

For use in X-Ray Diagnosis

The injection of iodised vegetable oils as a means of conducting explorations of various delicate organs and cavities of the body, for which purpose both barium and bismuth preparations are unsuitable, has now become routine. The method is particularly suitable for use in the examinations of the bronchi and the uterus.

In the Addendum 1936 to the B.P. 1932 the specification for iodised

oil (*Oleum Iodisatum*) is an iodine addition product of poppy-seed oil containing 39 to 41 per cent of combined iodine. It is a pale yellow, viscous, oily liquid, and is opaque to X-rays. Iodatol, 40 per cent, the original British-made iodised oil, conforms with this specification. Iodatol, 40 per cent, is available in bottles of 20 c.c. and 30 c.c. from the principal pharmacists.

Modern Iron Therapy

Iron 'Jelloids' are an elegant and reliable means of administering the proto-carbonate of iron. The preparation has none of the disadvantages of Pil Blaud. The iron content remains fresh and unoxidized indefinitely, and injury to the teeth is avoided.

The 'Jelloids' are highly effective in the treatment of achlorhydric anæmia and indeed in all the simple anæmias in which massive iron therapy is indicated.

Iron Jelloids

You are cordially invited to apply for samples for clinical test

In Chronic Infections and Chronic Complications

In the treatment of such chronic stages of disease as chronic rheumatism, chronic arthritis and fibrositis, whatever be the origin, Contramine has been used with considerable success for many years. Contramine also is of special

value as an antidote against metallic intoxications, and it is used as a preventive and a palliative in metallic poisonings of various kinds, indeed, as long ago as 1922 (*Lancet*, 1922 i, 733) it was used in the treatment of arsphenamine-jaundice.

★ OVOFERRIN BRAND COLLOIDAL IRON TONIC

Effective Iron

COLLOIDAL ASSIMILABLE PALATABLE

Ovoferrin, the palatable blood builder, is stainless, odourless, non-astringent. It is iron in its most minute, most useful colloidal subdivision. Ovoferrin does not constipate, it does not affect the teeth or stomach, rather, it stimulates the jaded appetite and often aids in intestinal peristalsis. Many physicians have found it to be the only preparation simple, agreeable and effective enough for long term iron feeding. Ovoferrin contains no flavouring or sugar, it is economical to use and an excellent vehicle. Samples gratis to physicians.

OVALTINE

BEFORE AND AFTER OPERATIONS

THE use of Ovaltine before a major operation is of great service in helping to build up the system against the strain involved by operative interference. In abdominal cases especially where a light and unirritating diet is necessary the use of Ovaltine alone for a few days before the operation will be found sufficient to maintain the patient's nutrition at a sufficiently high level.

After severe operations the regular use of Ovaltine is of the greatest service on account of its bland nature, its ready digestibility and its highly nourishing and sustaining properties.

Ovaltine is a complete food composed of fresh full cream milk, eggs and malt extract, in the form of crisp granules which dissolve readily in milk to form a delicious beverage acceptable to the convalescent patient.

FOR THE MICROCYTIC ANÆMIAS
DEBILITY AND FATIGUE

COLLIRON

(Evans)

Colloidal Ferric Hydroxide
with a trace of copper

Colliron is of particular value in stubborn anæmias as it can be given in a heavy dosage, if desired, without aggravating digestive trouble. It has proved to be very suitable for the treatment of anæmias associated with Pregnancy and Hæmorrhage.

In every way Colliron is an ideal form of iron. It is readily assimilated and is therefore prompt in its tonic action in debility and fatigue. It is non-constipating and almost free from ferruginous taste.

Being highly concentrated a small dosage suffices for average conditions.

THE DOSAGE OF COLLIRON

5 minims of Colliron contains the same amount of iron as a Bland's Pill

Adults 20 minims three times daily after meals, or for intensive treatment, one teaspoonful once or twice daily, increasing to one tablespoonful two or three times daily

Children 5 to 10 minims three times daily after meals, or for intensive treatment, 15 to 30 minims once or twice daily, increasing to one dessertspoonful two or three times daily

Colliron is issued in

BRAN

as effective as
strong laxatives...
without the
consequence

7 1/2 D
Per
Packet

Most modern diets being deficient in bulk, the addition of a laxative agent becomes a necessity. Kellogg's ALL-BRAN supplies this deficiency and ensures regular elimination. ALL-BRAN needs no cooking. It is served with milk, cream or fruit and, in combination with moisture, forms a sponge-like mass in the body. This gently exercises the intestines and stimulates natural action.

Some patients prefer Kellogg's ALL-BRAN cooked in biscuits, cakes, omelettes, etc. It is rich in easily assimilable Vitamin B and iron.

Kellogg's ALL-BRAN is effective in all constipation cases except where a hyper-sensitive alimentary tract makes its use inadvisable.

Full-sized sample packet free on request.

Follow-on Trufood

a highly nutritive food

with feeding-tables allowing for the
progressive introduction of solids

An infant is fed accurately with a measured amount of food during all the stages of the first nine months of life. A carefully planned diet is of equal importance during the second period when, all too often, mothers are ignorant of the kind and of the quantity of food that should be given.

Follow-On Trufood has been created so that accuracy can take the place of guesswork during the whole early period of a child's life, right up to the time when the child can pass to an adult diet.

Follow-On Trufood contains Animal Proteins, Bone-marrow, emulsified Cream Fat, the soluble carbohydrates Lactose and Glucose, Mineral Salts, Organic Iron, Lecithin, Calcium with Vitamins A, B₁, B₂, and D from natural sources.

Complete feeding-tables, giving full instructions for the progressive introduction of solids, are provided with each tin of Follow-on Trufood.

Further particulars and samples of Follow-On Trufood will be sent on request to

FURUNCULOSIS

From information received —

"I tried Cystopurin on a patient with furunculosis who had resisted treatment with vaccines yeast, etc. He showed marked improvement, the boils being much less enlarged and painful and less frequent."

I am glad to be able to say that the improvement in the case of furunculosis treated by Cystopurin has continued — no further recrudescence has occurred"

"I tried Cystopurin in a case of furunculosis and the results were satisfactory"

"A young healthy man aet. 35 years, had developed an acute cystitis — after thorough investigation — cystoscopy X ray etc. etc., bladder irrigation was undertaken, but he developed numerous boils over the whole abdomen below the umbilicus and the gluteal area. Fresh ones appeared daily — about 8 to 10 — in spite of treatment, and this went on for 3 weeks much to his discomfort.

"I started him on Cystopurin — 5 tablets daily and he ——— twice daily. On the second day he informed me with delight, that he had no new comers" I continued treatment for one week with still no fresh appearances. Now after 5 weeks, he is still clear and out and about."

Supplied in bulk and in tubes of 20 tablets for dispensing purposes

GENATOSAN LIMITED, Loughborough, Leicestershire

The Wider Field of Application of BALANCED ALKALINE MEDICATION

HYPERCHLORHYDRIA, hyperacidity, nervous dyspepsia and ulcers of the stomach and duodenum have always been considered as conditions for which alkali medication is indicated, but there are also pathological manifestations far removed from these conditions which have been found to respond to proper alkaline medication.

Clinical experience has shown that the alkalies chosen in 'BiSoDoL', viz sodium bicarbonate and magnesium carbonate, are therapeutically an ideal combination. The sodium bicarbonate offers the system a readily available alkali and the insoluble basic carbonate provides pronounced alkalinizing powers against acidity as it arises. The mixture presents a combination of unusual buffering agents and avoids therefore the possible danger of alkalosis, which is associated with the administration of a single alkali.

While the formula of 'BiSoDoL' was originally evolved for the correction of acid conditions of the stomach, so suitable has it been found in balanced alkaline medication, that it is now largely prescribed in this wider field.

If you require samples and literature

Two valuable foods compared

The figures are for quantities of 1 oz. each of Milk and Bemax

That the Vitamin B₁ content of Bemax is 60 times that of milk is probably not surprising, but the fact that its calorific value is 5 times greater than milk, and its protein and carbohydrate content ten times as high (to quote only three examples from the above charts), emphasises the high all-round nutritional and therapeutic value of this natural Vitamin tonic food. Special importance probably attaches to the high IRON content of Bemax.

Laboratory reports on Bemax and a clinical sample for personal trial sent on request

The Bemax Laboratories (Dept B 36), 23 Upper Mall, London, W 6

Clinically, Nembutal is one of the safest of the barbiturates. This is partially due to the drug's brief action which permits rapid recovery; partially to the fact that Nembutal's powerful hypnotic and pronounced sedative effects are produced from a dosage only about one half that required with most other barbiturates, thus greatly reducing the amount of drug to be eliminated. • These qualities have brought Nembutal into world-wide usage not only as a pre-anæsthetic sedative but also for use in treating insomnia, convul-

sions from strychnine or other poisoning, eclampsia, hysteria, sea sickness, nausea from any cause, delirium tremens, as a supplement to morphine in controlling the pain of early cancer, in psychiatry and in obstetrics—with or without morphine and hyoscine. • Technique is simple. As a hypnotic, one 1½-grain capsule is sufficient. For sedative effect only, the ½-grain capsules are used. Rectal administration produces the same effect and is preferable for children. For pre-anæsthetic sedation and as a basal hyp-

notic, two or more 1½-grain capsules are given irrespective of the anæsthetic employed. • In obstetrics the dosage is three to five 1½-grain capsules. • Nembutal is supplied by prescription pharmacies in ½-grain and 1½-grain capsules, as well as in a variety of other useful forms. Literature and free trial sample will be sent upon request. The coupon is for your convenience.

A major operation in progress in the operating theatre of a London Hospital

DEGREES OF PROTECTION . . .

THE most elaborate precautions against every possible chance of germ infection are of course essential in the operating theatre. It would be ridiculous, however, to expect anything approaching this meticulous attention to antiseptic cleanliness in everyday hygiene and in the home treatment of superficial wounds.

The general public is nevertheless beginning to realise the importance of germ-free cleanliness. Hygienic standards to-day are higher than they have ever been. It is generally agreed by medical men that although regular use of antiseptics is not desirable or really necessary for ordinary toilet purposes, the use of a reliable antiseptic soap can play a very valuable part in the prevention of infectious disease. Face and hands are continually exposed to infectious germs, and require washing with Wright's Coal Tar Soap.

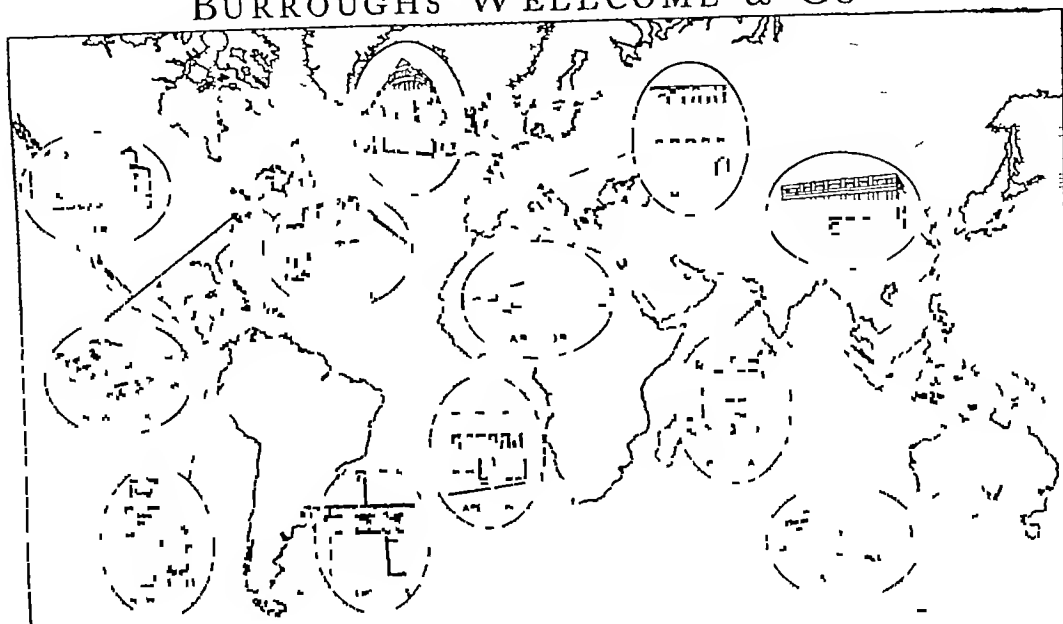

Wright's has substantial antiseptic and antipruritic qualities. For over 70 years it has enjoyed the confidence of the medical

profession, and to-day more doctors use Wright's than any other brand of toilet soap. Wright's Coal Tar Soap is prepared from materials selected after stringent tests. It is the only soap in the world to contain 'liquor carbonis detergens' (Wright's), the valuable dermatological therapeutic recommended by skin specialists the world over. In surgeries, hospitals, nursing homes and private households Wright's meets all the requirements of modern everyday hygiene. You can use it and recommend it to your patients with complete confidence.

THE HABITUAL ABORTION AND STILLBIRTH SYNDROME AND LATE PREGNANCY TOXAEMIA
VITAMIN E AND THE PROLAN-PROGESTERONE MECHANISM

BY

JAMES YOUNG, D S O., M D, F R C S., F C O G

Professor of Obstetrics and Gynaecology University of London Director of Department of Obstetrics and Gynaecology British Post Graduate Medical School Hammersmith Hospital London Consulting Obstetrician Edinburgh Royal Maternity and Simpson Memorial Hospital Consulting Gynaecologist Royal Infirmary Edinburgh

In previous communications I have published evidence for the view that the factors responsible for late pregnancy toxæmia tend in a high proportion of the other pregnancies of women so susceptible, to cause abortion, accidental hæmorrhage, etc., without toxæmia (Young 1914, et seq) From a study of the reproductive history of 220 successive cases of toxæmia at the Edinburgh Royal Maternity Hospital I (1927) concluded "that women with an eclamptic history commonly have resident within their body some morbid influence, which is not inconsistent with good health between their pregnancies, but which is inconsistent with the normal continuance of pregnancy to term Many of the damaged pregnancies in such women end in abortion, some end in premature birth or stillbirth but only in comparatively few such pregnancies does this constant and imminent x factor culminate in a toxæmic attack."

months For a fuller study of these questions and for the data on which we have built up the hypothesis of placental intoxication in an attempt to correlate the clinico-pathological data embraced within the toxæmia phenomenon the reader is referred to the previous papers mentioned. These papers also present evidence for the contention that the common attribution of the recurring obstetric disasters of such women to a persisting 'nephritic' factor (chronic nephritis, low reserve kidney, etc) has for long diverted attention from the realities of the situation and has sterilized much sincere effort directed to the elucidation of primary factors

The X Factor and Recent Discoveries

Recent investigations have opened out to us a possible new avenue of approach in our search for the missing factor in the habitual abortion-stillbirth-toxæmia syndrome This evidence has come from two directions In the first place since Wiesner (1931) showed that a negative A-Z reaction in a living pregnancy implied a high risk of abortion or premature birth, the luteinizing factor obtained from pregnancy urine or the corpus luteum hormone itself has been used with considerable success in the treatment of habitual abortion (Johnstone et al 1932, Krohn et al 1935, Kane 1936) We have ourselves the completed and consecutive histories of seventeen women who between them had fifty-one successive pregnancies ending in abortion, premature stillbirth, stillbirth, or early neo-natal death before coming under treatment In seventeen subsequent pregnancies under treatment with urinary prolan there were fifteen which ended in the birth of a surviving child—that is, a 100 per cent failure was transformed into an 88.2-per cent success The circumstances attending the administration of prolan and progesterone strongly suggest that it operates in the form of a true substitution therapy At the same time the pregnancy gonadotropic test may be positive in cases which respond to the therapy, and this makes it necessary for us in the absence of quantitative data to exercise caution in our interpretation of the phenomena This attitude of caution is all the more necessary in that successful therapy is obtained with a unit dose of hormone which is infinitesimal in comparison with the quantities known to exist in normal pregnancy Thus whereas 100 rat units of prolan twice weekly may be clinically sufficient it is known that the excretion of this hormone in healthy pregnancy reaches several and often many thousands of rat units per litre of urine

TABLE I—The Habitual Abortion and Stillbirth Syndrome in Toxaemia

Case	Pregnancy	Case	Pregnancy
1 (1543)	(1-7) Normal (8-10) Abortion (11) Eclampsia	6 (1442)	(1-2) Normal (3) Premature stillbirth No toxæmia (4) Eclampsia
2 (827)	(1-2) Normal (3-7) Abortion (8) Eclampsia	7 (1393)	(1) Full term Toxæmia (2) Accidental hæmorrhage Premature still birth. No toxæmia
3 (1551)	(1-2) Abortion (3) Eclampsia	8 (1312)	(1) Normal (2) Abortion. No toxæmia (3) Accidental hæmorrhage Premature stillbirth Toxæmia (4) Accidental hæmorrhage Premature still birth. No toxæmia
4 (1764)	(1) Normal (2) Premature live birth (3) Normal (4) Stillbirth (5) Premature live birth (6) Eclampsia		
5 (1422)	(1) Premature stillbirth (2-3) Abortion (4) Eclampsia		

In Table I which represents the reproductive history of cases selected from a large number of similar clinical records these facts are brought out in a striking manner They exhibit the frequently recurring nature of the phenomenon and demonstrate that this may begin with the first pregnancy or alternatively, it may only appear during subsequent pregnancies as an 'acquired' taint. Further they bring out the important circumstance that the toxæmic element, in general, only obtrudes itself where the damaged pregnancy has advanced to the later

Significance of the Results

In Tables II, III, and IV we have collated our personal cases, completed and otherwise. To appreciate the full significance of these results it is important to recognize that, in so far as they refer to women who present themselves for treatment because of their history of recurring obstetric disaster we can naturally to a large extent eliminate from the history such irrelevant causes of repeated abortion as intentional interference. Indeed, in the majority of instances their failure to carry is to such women a source of great distress. Further, it is to be noted that in all cases the Wassermann reaction is proved to be negative and there is no detectable pathology to account for their symptoms, such as retroflexion and deep cervical laceration.

The second important line of advance is based upon the recognition of the part which essential food substances play in the nutritional maintenance of the pregnant state.

In lower animals it has for long been known that the reproductive processes are sensitive to dietetic influences and that imperfect feeding may in a variety of ways disturb the fertility of the animal by leading to sterility or to interference with the growth of the foetus in the uterus. Vitamins A and E would seem to occupy a special place in the reproductive processes, in that gross deprivation of either, whilst consistent with apparently normal health of the mother animal, is attended by serious interference with the intra uterine development of the foetus. So far, no adequate attempts have been made to assess the possible significance of the vitamin A factor in human pregnancy but there is now a considerable body of evidence in respect of vitamin E. The work of Evans and his collaborators (Evans and Burr, 1927, Evans, 1932) on the specific relation between vitamin E deficiency and a form of 'habitual abortion' in lower animals has inspired the use of this vitamin in human pathology. In rats (and the same facts have been shown to apply to some other animals) gross deficiency in E, without disturbing the general health and vigour of the animal, and without affecting oestrus and the faculty of fertilization leads to a progressive disturbance in the nutrition of the foetal placenta and to maceration and resorption of the foetuses in the uterus. Vitamin E administered during the earliest stages of pregnancy is capable of anticipating and preventing this foetal destruction but after the critical phase of placentation, replacement of vitamin E is valueless. Congestive and haemorrhagic changes of a secondary nature occur in the maternal placenta of such affected gestations, and this is associated with vaginal bleeding. Whilst analogies drawn from animal pathology are apt to be an insecure basis for argument it cannot but be regarded as suggestive that, in the case of the π factor that constitutes the background of the human problem and the E deficiency as it affects the animal, there are three striking points in common: first, the general health of the host remains apparently normal; secondly, repeated and often rapidly succeeding mating and impregnation is the rule; thirdly the successive pregnancies are blighted. To these three admittedly striking analogies we have to add a fourth, the fact that in each case the exhibition of a preparation containing vitamin E (wheat germ oil) at a sufficiently early stage breaks the sequence and, in a large proportion, enables the normal carrying of the pregnancy to full term. There is now considerable evidence in the literature (Vogt-Moller 1931 1933 Juhász-Schäffer, 1933 Watson and Tew 1936) as to the efficacy of wheat germ oil in habitual abortion and stillbirth in women, and Shute (1937) has employed it with success in cases of accidental ante-partum bleeding.

The outstanding nature of the progress to which these discoveries witness can be best realized by those who recall the hopelessness with which the subject of habitual abortion and stillbirth was regarded in former days. Writing in the 1917 edition of his textbook Whitridge Williams (1917) expressed the views then current when he said: "nor will the most extended clinical study give a clue to the cause and consequently the treatment of such patients is empirical and altogether unscientific. And again the treatment of repeated abortion is in general so unsatisfactory as to constitute one of the opprobria of obstetrics."

It remains for the future to establish a correlation between two discoveries which have so strikingly and so unexpectedly converged towards the solution of one of our most baffling clinical problems. Meanwhile the available data are consistent with the view that vitamin E possesses specific significance for the nutrition of the

placenta, and that, in some manner which is not clear it operates through the activation of the luteinizing mechanism. The problem is complicated by several physiological uncertainties regarding the site of origin of prolan and progesterone in human pregnancy which are not directly germane to the subject of this paper. It is generally believed that during the pregravid and the early gravid periods the anterior pituitary is responsible for the elaboration of the luteinizing hormone and the ovary for the production of progesterone, but that in the human subject this dual function is during the later stages of pregnancy performed by the placenta. We have no means of knowing which part or parts of the placenta are concerned in this reciprocal action. From the large output of the luteinizing substance in hydatid mole and chorion epithelioma we might by analogy be justified in ascribing the source of this hormone to the foetal elements of the placenta in ordinary pregnancy. From the excessive formation of luteal tissue which in these abnormal chorionic states may take place in the extrachorionic or maternal tissue of the ovary, we might by analogy ascribe the source of the luteal hormone to the maternal placenta in an ordinary pregnancy. If it could be established that the two hormones spring from different biological sources in the placenta it would be interesting to speculate whether vitamin E bears any special and differential relation in regard to the tissues concerned. In this connexion some recent observations on the effect of vitamin E deficiency on the gonadotropic functions of the anterior pituitary possess a special interest. It has been shown (Rowlands and Singer, 1936) that the pituitaries of rats fed on an E free diet are markedly defective in the luteinizing or ovulation producing hormone as tested on oestrous rabbits. At the same time neither anterior pituitary nor luteinizing pregnancy urine extracts are capable of preventing the resorption of the foetuses in an E free rat (Diakov and Krizenecky 1933, Geller, 1933, Rowlands and Singer 1936).

Toxaemia and the X Factor

While there is still some uncertainty in regard to the interpretation of the scientific data, there would seem to be no room for doubting that these recent discoveries have brought us within measurable distance of a solution of the habitual abortion-stillbirth complex in women. The fact that we can eradicate the underlying taint in a percentage which in different records varies between 75 and nearly 90, and that the earlier the treatment is instituted the higher the success helps to establish this claim on a secure basis. In view of the significant part which we have shown a habitual abortion-stillbirth sequence to play in the toxaemic phenomena, it might be assumed that the further step—namely, the merging of these phenomena within the same deficiency ambit—should be easy. We, indeed, began our investigations on this aspect of the question in the hope that the possession of the therapeutic key to the abortion sequence would automatically enable us to unlock the major secret. In this we have been disappointed. At the same time, certain data which have emerged during these investigations have seemed to us worthy of being placed upon record, especially as they relate to observations that can only be adequately tested on a larger scale than is generally possible in a single clinic. These observations can conveniently be discussed under four headings.

1 Influence of Prolan and Progesterone on Confirmed Cases of Toxaemia

Over a period of about five years (since the discovery of the efficacy of prolan and progesterone in abortion) we have at different times and as the clinical potency of the commercial preparations improved, exhibited urinary prolan or progestin preparations as also vitamin E concentrates to a considerable number of cases of established toxaemia. The results of these experimental trials have been almost uniformly negative. Except that in a few

instances of previously persisting hypertension we have noted a maintained lowering of the blood pressure and that in several cases severe headache and visual disturbance exhibiting the usual toxic character disappeared at once after the administration of urinary prolan we have been unable to arrest or control confirmed and aggravated cases. In the majority of instances there has been no effect on the hypertension and in none has the degree of albuminuria been appreciably lessened.

It is of course conceivable that, as in the habitual abortion of women and the blighted pregnancies of the lower animal, failure may be attributable to the fact that, unless commenced before the critical stage in placentation the damage may be irrecoverable. This view would necessarily imply that where toxæmia occurs in the later months the causal factor from which it springs has in general operated during the early months, and that an interval clinically non-toxaemic separates the two events. The observations of Henry (1936) may, however, possess some relevance in this connexion. From a retrospective study of a large group of toxæmic patients this worker claims that in a high proportion evidence of the toxæmic process in the shape of a steadily mounting blood pressure may be discovered from as early as the fourth month. While they do not necessarily conflict with this view there is especial interest attached to the claims made by Shute (1937) that cases of premature separation of the placenta, even in the later months, can be successfully treated with vitamin E. This observation has an added interest on account of the close clinical relation known to exist between this condition and the toxæmic phenomena.

A factor which has militated seriously against the institution of an adequate testing of the preventive possibilities of the new therapy has been the paucity of material which our present management of toxæmia necessarily implies. It is obvious that the most suitable clinical material for such a purpose is the woman in whom, as we have shown in previous communications, the recurrence of toxæmia in two or more successive pregnancies enables us to infer an almost 100 per cent risk in any succeeding gestation. But this has been just the class of case in which, with our existing knowledge, we have in general felt constrained to urge limitation by means of sterilization or failing that by contraception. This has left for experimental purposes a small group which are set out in Table IV, where, despite previous toxæmic stillbirths or a recurring series of alternating non-toxaemic and toxæmic pregnancies the patient has insisted upon making a further attempt during which the opportunity for the institution of early therapy has become possible. The results are suggestive especially when we have regard to such apparently hopeless clinical prospects as are represented by Cases 1, 6, 7 and 8 (Table IV). Cases 1 to 8 further raise the question as to how far early commencement of the therapy may have succeeded in preventing or in controlling the toxæmic manifestations destined to develop in the later months and in this way to enable the gestation to be carried in safety to the birth of a living child.

2. Unmasking of Toxæmic Taint in a Pregnancy Successfully Carried to the Later Months

We have shown (Table I) that women with a history of repeated abortion seem to be exposed to a special risk of toxæmia in a pregnancy which extends into the later months. Similarly, in a case under treatment because of a history of repeated abortion the successful carrying of the pregnancy to the last trimester by means of the substitution therapy may unmask the toxæmic taint (Cases 2,

5, 7, and 8, Table IV). This may imply that the factor making for toxæmia is identical with that responsible for abortion and that, whilst the latter has been prevented there has been left behind damage sufficient to initiate a toxæmia at a later date. It is clear that considerable evidence on this subject is required before we can speak with certainty. In the present state of our knowledge it is impossible to deny either that the previous abortions and the toxæmia may arise from one and the same source—a source other than that under consideration—or, alternatively, that the toxæmia has an entirely independent origin appearing merely because the pregnancy has been steered into the later and more vulnerable stage. That this unmasking phenomenon is by no means infrequent is demonstrated by the fact that we have recently obtained records from obstetrical colleagues of four further cases.

TABLE V—Toxæmia and Negative Friedman Test

Case No.	Age	Previous Pregnancies	Present Pregnancy		
			Pregnancy Test	Toxæmia	Result to Child
1 (11357)	22	Nil	Friedman— 35 weeks	B P 170/105	Induction at 35 weeks Alive and well
2 (11425)	34	Nil	Friedman— 17 weeks	B P 158/98 Severe headaches	Progressing at 20 weeks
3 (11321)	26	(1) 8 mths. 28 hrs. Died (2) 7 mths. 8 hrs. Died	Friedman— 27 weeks	Headaches Visual disturbance	Progressing at 33rd week Toxæmic symptoms subsided

3 The Gonadotropic Pregnancy Test in Toxæmic Cases

In two recent cases of toxæmia (Table V, Case 1, thirty five weeks pregnancy and Case 2 seventeen weeks pregnancy) the Friedman test, carried out to determine the question of foetal survival was negative although subsequently the foetus was found to be alive. In Case 3 (Table V) that of a woman with a history of two previous premature children that died shortly after birth, the Friedman test was negative at the twenty seventh week of the third pregnancy in association with mild toxæmic symptoms. On the other hand, in one woman (Case 7, Table IV) who had a previous history of three dead children born at full term, and who during her fourth pregnancy had long-continued ante partum bleeding with some mild toxæmic symptoms the Friedman test was positive at the twenty-eighth week. In a further case (Case 2, Table IV) with a previous history of two abortions, the Aschheim-Zondek test was positive at the third month, while toxæmia developed at the thirty ninth week. No test was made at this later date. The negative findings in the three first cases quoted possess a special interest in view of the observations of Smith and Smith (1935) who claim that late pregnancy toxæmia is associated with an increased output of gonadotropic hormone.

4 Breaking of the Chain

Where there has been an unbroken habitual abortion-stillbirth sequence in which toxæmia features, the breaking of the chain of disaster under treatment and the birth of a live child is one of the most suggestive findings (Cases 1 and 6 Table IV).

The fuller records of some of the cases epitomized in the tables are instructive.

Case 1 (Table IV) aged 37 had suffered from severe and progressive toxæmia during the two preceding pregnancies.

the first ending in a stillbirth after artificial induction at the seventh month the second ending spontaneously at the seventh month in the birth of a child which lived two days. She had been warned against further pregnancies. Disregarding this she was first seen by me at the fifth month of her third pregnancy when her health was good. The Aschheim Zondek test was positive. She was placed on prolan therapy and carried to the thirty-seventh week when the blood pressure began to rise (140/90) and a trace of albumin appeared in the urine. Induction at the thirty-eighth week resulted in the birth of a healthy child which survived.

Case 5 (Table IV) aged 40 had a history of sound health apart from three previous abortions between the third and fifth months. She suffered from hyperemesis during the third month of her fourth pregnancy for which hospital treatment was required. At the fourth month there was some vaginal bleeding. Under prolan treatment the pregnancy progressed satisfactorily till the thirty-eighth week, when albuminuria (0.05 per cent) appeared with moderate hypertension (145/90). She was delivered at full term of a strong infant.

Case 6 (Table IV) aged 36, had had six obstetric disasters before being seen by the writer. Two abortions each at the second month were followed by a third pregnancy in which there was very severe toxic hyperemesis ending in a four-months abortion. The fourth pregnancy ended at the seventh month in a stillbirth after very grave toxæmic manifestations associated with coma. The fifth pregnancy ended in a three-months abortion, and the sixth with placenta prævia at the fifth month. Between the fifth and sixth pregnancies she was examined by a London obstetrician who found her in the enjoyment of sound health. The writer first saw her after the sixth disaster when apart from some septic teeth and mildly inflamed tonsils which were removed she was found to be healthy. A full investigation revealed no evidence of renal disorder. Though I made careful observation during a seventh pregnancy the membranes ruptured spontaneously at the sixth month and four days later a macerated infant was delivered. There was no evidence of toxæmia. Despite this disastrous record the patient persisted and under prolan therapy gave birth to a live child at full term after an uneventful eighth gestation. The statement regarding this last pregnancy we have received from the medical attendant of the patient.

Case 7 (Table IV) aged 23 had had three previous deliveries all at full term. The first child was stillborn the second lived a few hours, and the third one week. No cause was given for the death of the infants. She was first seen at the ante-natal clinic at the twenty-seventh week of her fourth pregnancy with a history of what she described as a more or less regular monthly loss of blood from the vagina lasting for two days on each occasion and continuing from the second to the eighth month. There was occasional abdominal pain and nausea and vomiting had been present daily throughout. The Friedman test was positive. She was placed upon prolan therapy and apart from a transient albuminuria and a slight rise of blood pressure (diastolic 90 mm Hg) she went to term and was delivered of a child which was strong and thrived well.

Diet and Fertility

The gradual emergence of the specific significance of dietetic factors in relation to fertility necessarily raises questions the importance of which extends beyond the range of the problems that beset the clinician. For it is obvious that in so far as deficiency in these elements becomes increasingly identified with the factors responsible for abortion it assumes a place of first rate importance in the national economy. At the present moment it is impossible to state with any certainty the incidence of abortion which falls into this category. We may however safely assume that it constitutes a considerable proportion of "spontaneous" cases, and that it therefore must receive special attention in any future study of the factors which influence the national birth rate. The reorientation of our outlook on the bearing of diet on racial fertility which the

recent discoveries necessarily imply must awaken a new interest in the study of these problems and, more especially, as to the degree in which changes in the diet of the country have contributed to the steady decline in the birth rate during the past seventy years.

Summary

The evidence which has become available within recent years is consistent with the view that an important cause of the habitual abortion-stillbirth syndrome, which has baffled the clinician in the past, is a disturbance in the metabolism of pregnancy, in which a deficiency of vitamin E is involved. The evidence further raises the question as to the part which vitamin E plays in the prolan-progesterone mechanism of pregnancy.

The clinical applications of the results of recent research are simple and impressive.

In this communication some evidence is adduced for the view that the above considerations may likewise supply us with the missing factor which we have previously postulated to explain the non-toxæmic recurrence of abortion, stillbirth, and accidental hæmorrhage in women who are subject to eclampsia and pre-eclampsia. This evidence is consistent with the view that major degrees of deficiency tend to interruption of pregnancy in the early months without toxæmic manifestations, whereas if the deficiency is less marked the pregnancy is capable of progressing to the later months with a consequent risk of toxæmia.

The evidence reviewed in this communication raises the question as to the part played by diet in racial fertility and more especially as to how far changes in the consumption of essential dietetic elements may have contributed to the declining birth rate.

The International Union of Local Authorities will hold a conference in Paris from July 5 to 11 under the patronage of the French Government. The two main questions for discussion are (1) pollution of the air by smoke gases and dust and (2) the supply of milk and the regulations necessary for public health. Dr Thomas Orr M.O.H. for Ealing is the British reporter on the question of milk and Dr J. Johnstone Jervis, M.O.H. for Leeds on atmospheric pollution. The sessions on these subjects will be held at the Maison de la Chimie, 28, Rue St. Dominique. The secretary for Great Britain is Mr I. A. Avis, 26 Abingdon Street, Westminster, S.W.1

THE TREATMENT OF MID-LINE VENTRAL HERNIA

BY

R WOOD POWER, F.R.C.S.I.

Senior Surgeon Herefordshire General Hospital

A new surgical operation or modification has often the unhappy knack of leaving complications or ill effects in its trail, often so marked as to render null and void what at first promised to be a surgical success. It is a curious fact that since Lister's time, when abdominal operations first became prevalent incisional hernias should have been and still remain such an unfortunate complication. No surgeon, of whatever standing can claim exception to this misfortune, for as long as surgeons operate so long will it occur. It has been truly said that the sole method of avoiding incisional hernias is to avoid operating.

A small ventral hernia does not present any great difficulty in its repair. It is the large umbilical and incisional hernias which present difficulties to the surgeon, and I wish to direct attention to these and to report the results of my operation in these cases.

There are three layers of the abdominal wall which have to be taken into account in the repair of a ventral hernia: the fascia transversalis, the muscular layer, and the rectus fascia, all of which must be replaced in their natural position. Of these three the muscle is by far the most important, and, strange to say, it is this layer which has been neglected in almost all types of operative repair. To guarantee a successful operation it is of paramount importance not only to mobilize the recti muscles the whole length of the hernial opening but to see that they are approximated in the mid line. Failure to achieve this will result in the rectus fascia having to shoulder the entire resulting strain. Fascia, however dense, will stretch in time and a recurrence will invariably follow.

Another consideration of great importance is that of tension. If at the completion of the operation any layer is under undue tension failure is almost certain to ensue. Tension causes strangulation of the tissues that results in sloughing and eventually the formation of scar tissue, which is a useless barrier to protrusion of the bowel. To quote Dickson (1935) on this subject: "It is much more important to direct effort to relieving wound tension than it is to devise some new type of suture material." A wound which is completely relaxed and without tension will have a good blood supply, and no matter what suture material is used whether absorbable or non absorbable or it might be said whether any at all is used, the wound will heal.

Scar tissue is a third factor which must be taken into consideration in the repair of a ventral hernia. It results from previous sepsis or interference with the blood supply at the neck of the sac. Such tissue is poorly supplied with blood, stretches easily, and forms a very inadequate medium for repair. If the operation is to be successful it is essential to excise all scar tissue and unite healthy normal tissue on both sides.

From the foregoing three aphorisms arise that are essential for sound operative technique in the repair of a ventral hernia:

- 1 Like tissue must be replaced by like tissue
2. There must be no undue tension on the wound at the completion of the operation
- 3 All scar tissue must be excised

Considerations of Operation

When confronted with a large umbilical or incisional hernia there are many points which have to be considered before embarking on an operation—the age of the patient, the condition of the heart and lungs, the blood pressure, the condition of the kidneys, the amount of obesity, and the general condition as a whole. Again, are we dealing with a simple hernia, or is there an obstruction or strangulation of the bowel beneath? Operations of this calibre in the aged (the type of case usually met with) are serious undertakings, for if the operation is carried out thoroughly it is a long and shock producing procedure. With so many factors to be taken into account it is obvious that no single type of operation can be suitable for all cases. When conditions are favourable and the patient not too old no operation can compare with the Gallie (1923) graft. I think this has been one of the great discoveries of the past decade and must have brought relief to countless sufferers. When carried out thoroughly the results are brilliant, and operations which before the advent of the Gallie graft were impracticable have now become commonplace.

But what of the patient whom we consider too great a risk for an operation of this length? What of the case with an underlying obstruction which we want to finish as quickly as possible? And again, what of the case to be operated upon for some other abdominal condition in which there can be no justification for spending a long time over the repair? If these patients can be cured of their hernias without endangering their lives it is obviously our duty to do so.

For some years I have been practising an operation that I have found eminently suitable for the "risky case" and for those cases complicated by obstruction or strangulation or in combination with other abdominal operations. It fulfils my three aphorisms, does not add a great deal of time to the operation, and, above all, the results have been most satisfactory and so far the hernia has not recurred.

Pre-operative Precautions

It is advisable to have these patients flat in bed for some days before operation provided there is no acute complication. This allows the bowel to settle in the abdomen and to get accustomed to its new position.

A second point we must guard against is increased post operative intra abdominal pressure which is a real danger to life following these operations. Pressure on the diaphragm interferes with respiration and predisposes to hypostatic pneumonia. It also produces cardiac symptoms from pressure on the heart and abdominal vessels. Acute dilatation of the stomach and ileus are fairly frequent complications. Ileus is a mysterious and grave complication of this operation. It is akin to the ileus associated with a tight spica plaster with which all orthopaedic surgeons are well acquainted. It is almost exclusively confined to hernias in the upper abdomen, and occurs whether the peritoneum has been opened or not. I have had two recent cases of ileus following the Gallie operation and strangely enough the peritoneum was not opened at either operation. One of the patients unfortunately succumbed, while the second recovered after several anxious days. This type of ileus is undoubtedly associated with increased intra abdominal pressure caused by sudden compression of the upper abdomen, for when it appears in conjunction with a spica plaster the mere act of splitting up the plaster will relieve the ileus. How increased intra abdominal pressure actually brings about an ileus I do not know, nor

have I ever had a satisfactory explanation of it, but that it is a grave complication there is no denying

As a precaution against post-operative ileus it is advisable to strap the upper abdomen for some days prior to operation. The strapping should be gradually tightened each day until the abdomen is firmly compressed. I believe that this gradually increasing pressure is a safeguard against post operative ileus

The Anaesthetic

Either local or spinal anaesthesia alone should be used in patients over 40 years of age. The older the patient the safer the operation becomes if local anaesthesia is used. A wide field of infiltration is often required, but this should not be a deterrent to its use. Spinal anaesthesia is very fine to work with, but it has many contraindications in the aged.

The Operation

For subumbilical hernias the modified Trendelenburg position is a definite aid in stout subjects, while the reverse position is true for upper abdominal work. The skin incision should extend well beyond the hernia at both ends of the wound, and any previous scar should be excised. In the case of umbilical hernias where the umbilicus has been obliterated or distorted a new umbilicus should be provided for when making the skin incision as practised by Bonney (1935). The sac, when reached, is freed from the subcutaneous tissues, the rectus sheath is then opened in a vertical direction, and this incision should extend into the normal area of the abdominal wall at each end of the wound. The sac can now be completely freed. Unless the sac is large, as in an umbilical hernia, it is quite un-

Fig. 2.—Showing the recti sheaths and muscles approximated by interrupted catgut sutures each suture passes through the muscle and fascia

Fig. 1.—Showing the releasing sutures in the recti sheaths after the peritoneum has been closed and all scar tissue removed

necessary to open or remove it, if the sac is left an enormous amount of time can be saved. When such a sac is opened the bowel or omentum is often found adhering to it. If any attempt is made to free such adhesions large areas may be left that require reperitonizing, which is time absorbing and shock-producing to the patient. If it is possible the sac should be inverted and the fascia transversalis sutured.

The next step is the excision of all scar tissue associated with the rectus fascia. This must be all very carefully removed as far laterally as the rectus muscle on either side, so that when the fascia is sutured normal healthy tissue is left. It is of paramount importance that this part of the operation should be carried out with great care at each extremity of the wound for these are the danger-points and the most likely sites for recurrences to take place. The recti muscles are now freed from the peritoneum special care again being taken to mobilize the muscles thoroughly at either end of the wound. The subcutaneous tissue is next dissected back to the lateral border of the recti muscles and a vertical incision is made in the rectus fascia near the lateral border of the muscle as shown in Fig 1. The wound is now ready for suture. It should be noted that the anterior sheath of the recti muscles is not disturbed this is important in aiding the approximation of these muscles.

Interrupted No 5 catgut sutures are inserted each suture passing through the recti muscles and fascia on either side as shown in Fig 2. Figs 3 and 4 show a cross-section of the wound before and after the insertion of these sutures. The wound is then closed with drainage which should not be omitted.

Fig 3—Showing a cross section of Fig 1

Fig 4—Showing a cross-section of Fig 2. Note how the muscles return to their normal dimensions when approximated in the mid line

Commentary

Several points of interest arise in connexion with this operation. First, what is the effect of the aperture left in the rectus sheath? Does it cause any weakness of the abdominal wall, and will a hernia occur at this site? Does it remain devoid of fascial covering, or does the fascia regenerate? So far as I can ascertain from examination of these cases some time after operation there is no weakness of the abdominal wall at the site of the incisions in the recti sheaths. This bears out what has always been my contention—that it is the rectus muscle which is the important constituent of the abdominal wall in the prevention of hernia. Fascia has for ages past proved quite inadequate in preventing the protrusion of the bowel unless the muscles are approximated at the same time. Failure to appreciate this point has led to disastrous results in the past. The main function of fascia in the body would appear to be to facilitate the free and smooth working of muscle to prevent any undue mobility and to protect it against any undue pressure. It is strongest where pressure is likely to be greatest, as in the palm of the hand and sole of the foot and weakest where muscle play is greatest, as over the biceps and calf muscles. That the absence of fascia is no great handicap is shown in the thigh when strips of fascia lata are removed for the Gallie operation. In a similar way the absence of fascia over a portion of the recti muscles leads to no ill effect. I am certain that it will never lead to a hernia at this site, and my results so far have borne this out.

It is difficult to dogmatize about the gap in the rectus fascia, but in all probability it is filled by scar tissue. Nature generally attempts repair by this method.

A second question that arises is what are the merits of this operation as compared with the Gallie graft, and should it take the place of this operation?

I do not think this question can be answered on such a small series of cases as I can present for I have performed this operation only on cases which I have not considered suitable for the Gallie graft. The Gallie operation is so brilliant that one hesitates to suggest any other operation to displace it. In future I intend to apply my operation in all cases of ventral hernia. I do not say this to belittle the Gallie operation in any way but merely to explore the results over a larger series of cases. I feel convinced that there is a definite place for such an operation as I have described, particularly in the aged when acute conditions are present and also in connexion with other abdominal operations.

A third consideration of importance is that of increased post operative intra abdominal pressure which may be a grave complication of the Gallie operation in upper abdominal hernias. As already stated, I have had two such cases recently, one of which ended fatally. In the operation I have described there is no tension on the wound at the completion of the operation, so this complication is eliminated.

Finally my operation is based on the fact that muscle, if properly mobilized will stretch to any extent when supported by fascia, and that fascia itself has practically no elasticity. When the muscles are freely mobilized there is rarely any difficulty in approximating them in the mid line and the additional support of the fascia will prevent the possibility of the sutures cutting through the stretched muscles after the operation. That the fascia will not stretch to the mid line without undue tension is obvious but when the rectus fascia is incised as I have described tension is non-existent.

Results

I can report but thirteen cases of this operation. All the patients are alive and free from recurrence. These cases extend over a period of six years so that the majority have had several years' freedom from their hernias and may, I think, be looked upon as cured.

HEREDITARY SEBACEOUS CYSTS

BY

J T INGRAM, M.D., F.R.C.P.

Honorary Physician in Charge of the Dermatological Department the General Infirmary at Leeds

AND

MICHAEL C OLDFIELD, F.R.C.S.

Senior Surgical Tutor the General Infirmary at Leeds

(WITH SPECIAL PLATE)

Sebaceous cysts are common yet it is remarkable that little is known of their exact mode of origin. It is known that these cysts on occasion may be inherited. Paget (1870) noted that 'perhaps in the majority of cases the bearers of these have known one or more members of their family similarly endowed'. We describe below a family in which multiple sebaceous cysts occur in five members of three generations. We know of only five similar families reported in the literature.

Paget (1870a) refers to a case observed by Mr James Reid. The patient was a woman aged 80 years who had numerous sebaceous cysts on the scalp. Three of her daughters showed similar cysts. Two and a half years before the death of the patient one cyst became inflamed, it was opened, and a discharge of sebaceous matter followed. A tumour developed at the site and grew to a mass nearly five inches in diameter before she died. Klausner (1917) described two families showing inherited multiple sebaceous cysts. In one family two brothers aged 18 and 24 years, and one of their three sisters aged 15 years were affected, the cysts had existed from 'earliest youth'. In the second family cysts occurred in three generations. Two brothers, aged 32 and 31 years had cysts from childhood. Their mother and grandmother had similar lesions in the skin. Praliken (1933) described a case of multiple sebaceous cysts in a man aged 48 years. The cysts had been present from the age of 12. His sister and his father were similarly affected. Parkes Weber and Schlüter (1926) at the Royal Society of Medicine recently showed two brothers aged 50 and 59½ years who suffered from multiple sebaceous cysts. The swellings were first noticed

soon after the age of 20 years and one or two of the cysts were partially calcified. Each brother had a conspicuous nodule on the dorsal aspect of one ring finger as well as numerous cysts on the trunk and forehead. Their father was said to have had a similar ring finger nodule, and one of the elder brother's daughters had a few cysts of the same kind.

Non familial cases of multiple sebaceous cysts are more common. Rayer (1835) described cases in which multiple follicular tumours occurred. These tumours, he said, may be called wens, steatomata, or atheromata. He quoted cases of multiple cyst formation described by Dagorn (Paris, 1822) and Ludwig (1793). Rayer admitted that the aetiology was obscure, but declared that cysts occasionally appear due to an hereditary disposition. Jamieson (1873) reported a case of a man aged 40 years in whom there were 250 sebaceous cysts which were distributed all over the body with the exception of the hands. When examined with a lens no 'black point' was discovered in the skin over them. He considered that the cysts arose by obstruction of part or the whole of the sebaceous follicle. Maclaren (1886) showed a case of multiple sebaceous cysts at the Edinburgh Medico-Chirurgical Society in 1886. The patient was a man aged 19 years who presented 132 cysts, which were scattered all over the body with the exception of the palms of the hands and the soles of the feet. Radcliffe Crocker (1888) described a similar condition as "multiple atheromatous cysts." He believed that the cysts were caused by accumulation of epidermis and sebaceous matter in the follicle with hypertrophy of the wall. Chiari (1890) after a necropsy upon a man aged 74 years who had died of tuberculosis, undertook extensive histological studies of atheromatous cysts which were disseminated over the whole surface of the body with the exception of the palms of the hands and the soles of the feet. Chiari described two types of cyst. Both were retention cysts due to accumulation of horny masses—in the first instance in the neck of the follicle and in the second, in the duct of the sebaceous gland. After reviewing the literature, he discussed three possible modes of origin:

(i) Cystic dilatation of the sebaceous gland and the hair follicle by retained secretion.

(ii) Complete new growth of the cysts in the connective tissue.

(iii) Separation of parts of the ectoderm during embryonic life.

He favoured the first theory of origin for sebaceous and follicular cysts but stressed the anatomical and histological difference between these cysts and dermoid cysts, which arise as embryonic inclusion cysts.

Bossellini (1898) described a case of multiple sebaceous cysts occurring on the trunk of a man aged 40 years. Pringle (1899) described a similar case in a man aged 21 years calling the condition "steatocystoma multiplex" and Günther (1917) recorded one in a man of 22 terming the condition "sebocystomatosis." Orr (1923) showed a male patient aged 32 years at the Royal Society of Medicine from whom 150 sebaceous cysts had been removed and many hundreds of others remained on the chest and abdominal wall. Arzi (1926-1930) gave an account of two cases in males and one in a female. In the latter the cysts were localized to the intermammary region. At Rostock in 1929 another case was reported and the aetiology of the condition reviewed. Oscar Gans (1929) described the histological features of the cysts in sebocystomatosis.

On December 13, 1935, one of us (J. T. I.) presented, as familial sebocystomatosis, a family of father, daughter, and two sons, at a meeting of the Leeds and West Riding Medico-Chirurgical Society. An account of these cases is given below.

Case I

Dorothy T., aged 21 years was admitted to the General Infirmary at Leeds under our care on December 5, 1935. She complained of disfigurement due to numerous swellings on her face and body. The lumps had been noticed first when she was 10 years old and they had steadily increased in size. Those on her right leg had become inflamed and painful. They burst, discharging obnoxious cheesy material for some weeks. She had never suffered from acne. She said that two of her brothers, her father, and her paternal grandmother had similar swellings.

On examination the patient apparently was a healthy young woman. Numerous swellings however were visible all over her body. They were roughly circular or oval in shape, a quarter of an inch to two inches in diameter. Some were yellow in colour, most however were covered by normal pink skin. They were fluctuant but not translucent. Some were tense but most were soft and of the consistency of putty. They were closely attached to the skin but free from the deep tissues. No comedones were seen. There were two swellings in the region of the right eyebrow, three near the left eyebrow, two below the right eyelid and four below the left eyelid. There were three large cysts on the forehead, to hide which she had grown a fringe. There were two on the back of the neck, two on the back of the chest, five in the buttock region, three on the thighs, six on the legs and six on each forearm. There were no cysts on the palms of the hands or the soles of the feet. There were three irregular scars on the front of the right leg, marking the site of the previously inflamed cysts.

Treatment.—On December 9, 1935, twenty of the most disfiguring cysts were removed under ether anaesthesia. The wounds were closed with fine eyeless needles and plastic sutures. The patient was discharged on December 18, when the wounds had healed. Nine months later she returned and asked to have two more cysts removed. On September 15, 1936, one was removed from the centre of the forehead and one from the left leg, under local anaesthesia.

Case II

Walter T., Dorothy's brother, aged 11, was re-examined in the out-patient department of the General Infirmary at Leeds on September 15, 1936. From the age of 6 years his mother had noticed swellings on his face, scalp, back, and the front of his chest. A cyst on the front of his sternum had been removed in 1931 and the scar was still visible.

A cyst one inch in diameter was removed from the region of the right eyebrow under local anaesthesia. There were three cysts of about the same size on the hairy part of the scalp but as these were hidden by the hair the patient and his mother did not choose to have them removed.

Pathological Report.—A number of the cysts were submitted for pathological examination and we are indebted to Dr. Côté working in the pathological department of the University of Leeds for the microscopical report, which was as follows:

"The appearance in each case is almost identical. The cysts are lined by a continuous epidermic lining, consisting of rete Malpighi, stratum granulosum and stratum corneum, and are filled with varying amounts of keratinous matter and amorphous granular debris. None of the cysts shows calcification. Each is surrounded by a thick avascular connective tissue condensation capsule. None of the sections includes skin or dermal appendages. The subcutaneous tissues surrounding the lesions appear normal except in the case of the cyst from the eyelid where there are many cholesterol clefts with numerous foreign body giant cells in relation to them."

The result of examination of the other members of the family are given below

Case III—George T Dorothy's married brother aged 24 had sixty-one cysts scattered all over his body. The fourteen cysts on his face and forehead were most disfiguring. There were many large cysts on his scalp trunk and limbs. His only child aged 18 months was examined but showed no cysts

Case IV—William T Dorothy's father aged 53 had five cysts on his forehead and three large cysts on his scalp from the time when he was quite young. Three cysts had been removed from his forehead soon after he was married. His only sister had been free from cysts

Case V—John T Dorothy's brother, aged 26 was not affected but had suffered from severe acne on his face when he was about 20 years old

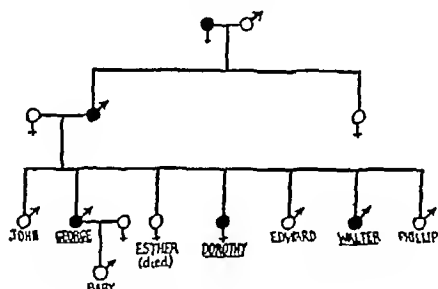

Case VI—Edward T aged 19 had no cysts but suffered from acne on his face

Case VII—Phillip T, aged 9 had no cysts.

Case VIII—Esther T who died when she was 18 years old from valvular disease of the heart, had been free from cysts

Mrs T, Dorothy's mother, was apparently free from cysts, but Dorothy's paternal grandmother was said to have had numerous swellings on her body, face, and chest

FAMILY TREE SHOWING AFFECTED MEMBERS OF FAMILY

The black signs indicate those bearing multiple sebaceous cysts. O free from cysts

It is interesting to note that alternate children in the third generation suffered from multiple sebaceous cysts. Cockayne (1933) believes that multiple sebaceous cysts may be inherited as a Mendelian dominant.

From the family table above the factor for multiple sebaceous cysts appears to be inherited in a Mendelian fashion, and resembles a dominant more than a recessive.

Commentary

Aetiology—Sebocystomatosis seems to arise most commonly in young adults. In many the cysts appeared at about 6 years of age. No case of congenital sebaceous cyst has been reported although Cockayne says they are first noticed in childhood and are probably congenital. According to Choyce (1932) cysts described as congenital sebaceous cysts are always dermoids. Men are more commonly affected than women. The Rostock view that the condition is confined to the male sex is certainly erroneous, female cases having been reported previously by Arzi (1930) Orr, Klausner, Prakklen, and others. Hereditary multiple sebaceous cysts are rare. In the family described above two of the unaffected members suffered from acne, but in no recorded case has attention been specially drawn to the presence of comedones associated with the cysts in a patient with

sebocystomatosis. Most cases appear for treatment because of the disfigurement, although itching in relation to the cysts has been described by Günther and Prakklen.

Pathology—The contents of the cysts in all the described cases have been yellowish or white pultaceous material, consisting of droplets of fat, chiefly cholesterol esters, fatty acids, and neutral fats. The epidermis over the cyst is usually normal. There is a narrow layer of cutis between the cyst and the epidermis. The cyst is lined by one or two layers of flattened epithelium. A layer of condensed fibrous connective tissue forms the outer wall of the cyst. In the immediate neighbourhood of the cyst, and sometimes embedded in the cyst wall, flattened atrophic sebaceous glands can be seen. Hyperkeratosis was noted by Bossellini and Prakklen in the upper part of the follicle near the orifice of the sebaceous gland. Giant cells embedded in the epithelial lining were described by Arzi.

In differential diagnosis it is important to distinguish sebocystomatosis from multiple lipomata and multiple xanthomata, molluscum fibrosum, neurofibromatosis, and epithelioma adenoides cysticum.

The cause of the condition is obscure. The common view is that the cysts are retention cysts, but the retention theory is not accepted by all, and there is much evidence to suggest that they are cysts of new formation. It is probable, however, that there are many types of sebaceous cyst.

1 Retention cysts

- (i) Follicular cysts, by obstruction of the infundibulum of the hair follicle
- (ii) Sebaceous duct cysts, by obstruction of the duct of the gland before it opens into the hair follicle

2 Cysts of new formation

- (i) Congenital in origin, arising from (a) epithelial rests, (b) overdevelopment of sebaceous gland structures
- (ii) Traumatic implantation cysts

Paget (1870) believed that most cysts of the scalp were cysts of new formation, although probably many cysts of the face and trunk and limbs result from distension of the hair follicles and their secretion. In support of this view he quotes Astley Cooper, South, Walther and Porta (Milan, 1856). However, he also refers to the work of Lebert and Bruns who described a slender cord traceable from the cyst to the skin which was supposed to be formed by the obliterated duct of the enlarged and obstructed hair follicle, but he remarks that this retention type of cyst must be rare.

1—Retention Theory

(a) **Hyperkeratinization**—Bossellini showed by serial microscopical sections that hyperkeratinization was present in the hair follicle above the orifice of the sebaceous gland duct, and as a consequence he believed that sebum was retained in the hair follicle, forming a cyst. Günther and Klausner confirmed these observations but Prakklen believed that cysts were formed sometimes by dilatation of the hair follicle and sometimes by dilatation of the sebaceous gland duct.

(b) **Primary Hypertrophy of the Sebaceous Glands**—Pringle regarded origin as hypertrophy of the sebaceous glands with retention of secretion. In support of this numerous hypertrophied sebaceous glands were seen in the neighbourhood of the tumours, which he removed.

and sectioned. Most other observers, however, have found that the sebaceous glands, far from being hypertrophied, are actually atrophied.

2—Cysts of New Formation

Many recent observers (literature by Benecke, 1931) have reverted to the view originally held by Paget that the majority of sebaceous cysts are cysts of new formation and that a true retention cyst of the hair follicle or sebaceous duct is rare. Benecke believed that the majority of the so-called sebaceous cysts met with clinically are more properly termed epidermoid cysts. These arise by the accumulation of secretion from isolated rests of epidermal cells lying within the corium. Other types of cysts of new formation have been described, arising as naevoid new growths or traumatic implantation cysts.

As evidence against the retention theory attention is drawn to (i) the rarity of cyst formation in cases of severe acne, (ii) the rarity of comedones in cases of sebocystomatosis, (iii) the difficulty of demonstrating by serial section an occluded or partially obliterated sebaceous duct, (iv) the occurrence of cysts of identical histological structure on the palms of the hands and the volar surface of the fingers, sites devoid of sebaceous glands and hair follicles.

Summary

A family presenting multiple hereditary sebaceous cysts is described. This type of case throws light upon the aetiology of the common sebaceous cyst. The evidence against the widely accepted theory of retention is discussed.

OSTEOCHONDRITIS DISSECANS

BY

DOUGLAS S. STEVENSON, M.B.E., M.B., Ch.B.,
F.R.F.P.S. Glas.

Assistant Physician Western Infirmary Glasgow

AND

FERGUS L. HENDERSON M.B., Ch.B.

Radiologist Glasgow Public Health Department etc

(WITH SPECIAL PLATE)

The differential diagnosis of certain diseases of bones and of joints is often a matter of difficulty, aetiological factors are obscure, and treatment and prognosis rest on insecure foundations. The condition known as osteochondritis dissecans is not an extreme rarity, and has been recognized for many years, but comparatively few cases have been recorded. In the present case we believe we have grounds on which to offer an opinion as to aetiology. The results of treatment will require to be reviewed later. Trauma is still held by one group to be the principal aetiological factor, while the 'non-traumatic group' to which we subscribe, disagree and believe that bone disease exists first and that following trauma the condition becomes more obvious and is diagnosed. Even then there is no unanimity of opinion as to the additional factor causing the peculiar features.

Case Record

This case, that of a well grown lad of 15 years was seen by one of us in August 1935, on account of some mild pain in the right elbow-joint with slight limitation of movement. Examination did not show any joint swelling—neither fluid from a synovitis nor synovial thickening—but on moving the joint it was felt that a loose body was present which on certain movements produced pain. The history was that about six to eight weeks earlier the boy had been hit on the elbow with a cricket stump—not a violent blow, and not causing much pain or disability at the time. Clinical examination showed no other abnormality, except that he has a considerable degree of bilateral congenital nerve deafness.

X-ray examination made on August 26, 1935, showed a small bony loose body lying between the head of the radius and the corresponding articular surface of the humerus. In the outer condyle of the humerus was an irregularly shaped area of decalcification. It was found impossible to demonstrate the loose body in a lateral view and accordingly accurate location could not be given. It was concluded that, as a result of injury, a small piece of bone had been detached from the outer condyle of the humerus and was now lying in the joint. These points are shown in the radiographs reproduced on the photogravure plate.

A surgical opinion was sought, it was decided that the loose body should be removed and this was done. At operation the synovial membrane appeared to be perfectly healthy, there was no thickening and no excess of fluid. The loose body was composed largely of cartilage with an ossified central portion was of the size and appearance of a white coat button—actually 2 cm. in diameter and 0.5 cm. thick at the centre—was smooth on the flat cartilaginous surface and rough with bony spicules on the concave surface. Some effusion occurred into the joint following operation, passive movements were not commenced for some days and were not well tolerated then. The boy was sent home after ten days with instructions to use the arm freely and to report in three months' time.

H. R. HATHAWAY, N. H. CISEL and R. M. WATERS (*Anesth. and Analges.* March-April 1937 p 89) review 491 administrations of oxygen in 408 patients. The oro-pharyngeal insufflation technique was used in 92 per cent of cases. This technique was conveniently and effectively applied with few objections and little discomfort. The authors were able to confirm statistically that early oxygen treatment of anaemic patients improves results. The fact that oxygen was not restricted to dangerously ill patients brought about a relatively low mortality rate.

curette edge. The tip of the instrument is made slightly conical but the lumen is left open (Figs 1, 2, and 3). Biopsy curettes of this type can also be made with a shorter tube at the tip so that mucosa is obtained from nearer the fundus—these have proved equally satisfactory in practice, except that the curetting is correspondingly shorter.

In obtaining the specimen the patient is placed in the lithotomy position and the usual antiseptic precautions are taken. The cervix is then pulled down with vulsellum forceps and the biopsy instrument is slid into the uterine cavity exactly as a uterine sound, no previous dilatation being necessary, in contrast to most other methods. The curette is placed against the mucosa of either the anterior or posterior wall drawn downwards for about an inch, and then withdrawn through the cervical canal avoiding any pressure of the curette edge against the cervical wall. After removing the curetting any further specimens of mucosa

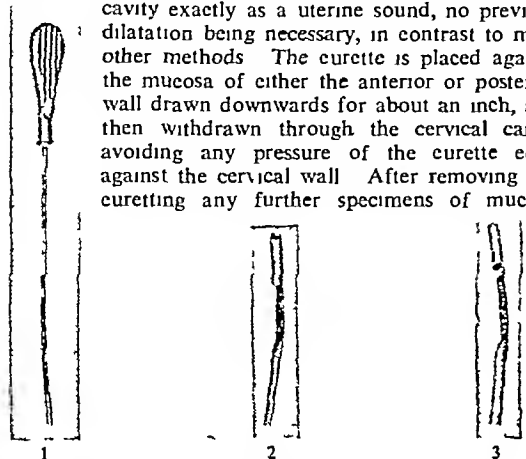

FIG. 1—Complete instrument (one-quarter actual size).
FIGS. 2 and 3—Details of head of curette (one half actual size).

required can be obtained by reinserting the instrument. Some discomfort is usually felt at the moment when the instrument first passes the internal os but this goes off immediately. There is also some discomfort when the tip of the instrument touches the fundus and to a much lesser degree during the actual curetting. This is referred to the lower abdomen. It is normally no more severe than to make the patient wince slightly. Neither at the time of the biopsy nor subsequently is the average patient any more disturbed than she is by an ordinary vaginal examination. No after-treatment or care of any sort is required. The absence of any real pain is very important from the point of view of obtaining the patient's co-operation when subsequent biopsies or a series of them are desired. On this point the present method appears to be a marked improvement on the suction methods. For example endometrial biopsy by this method has been performed in three cases every day for a whole month without any disturbance or concern to the patients at all.

The curetting is found lying flat with its mucous surface downwards in the tube at the tip of the curette. In most cases a solid piece of endometrium nearly 2 cm long and 3 mm in diameter is obtained—this is much more satisfactory than the fragmented material obtained by certain other biopsy methods though it is of course not possible to obtain such enormous curettings as those illustrated by Tamis (1936). The piece of endometrium is easily slid out of the tube by pulling its lower end gently with a needle, and is then placed, mucous surface upwards on a piece of thin card and dropped into fixative. In this way it is possible to orientate the block later so as to obtain longitudinal sections vertical to the mucous surface. This makes the histological interpretation much more easy and reliable. Fig. 4 (see Plate) shows the naked-eye appearance of a typical section of endometrium on an ordinary 3 inch by 1 inch slide and Fig. 5 its microscopical appearance.

Conclusion

There is no need here to stress the great diagnostic value of endometrial biopsy in many conditions particularly in the investigation of sterility in women and of disturbances of menstruation, but mention may be made of its definite scientific value in studying the endometrial responses to various hormones. It is obviously a great advantage to be able to obtain endometrium for examination by a simple out-patient or consulting room procedure without anaesthesia, without risk, and with no real pain. Endometrial biopsy has up to now not been employed as extensively as it might because the methods have not been sufficiently simple and reliable and also because the histological value of the material obtained has been rather uncertain. With the instrument described here the main difficulties in endometrial biopsy appear to have been overcome.

The instrument was made for us by G. B. Ritchie, 249 Buchanan Street, Glasgow.

EPILEPSY AND CYSTICERCOSIS

By

A. J. P. ALEXANDER, M.D. Belf., M.R.C.P.J.
M.R.C.P. Lond.

Honorary Teacher of Medicine University of Bristol. Senior
Medical Officer Winsley Sanatorium near Bath.

(WITH SPECIAL PLATE)

Clinical notes of the following case, with a radiograph are placed on record to call renewed attention to the fact that the cysticercus stage of *Taenia solium* though usually passed in the pig can develop in man and that patients so infected generally come under observation when suffering from attacks of 'epilepsy' or from other neurological symptoms and signs that cannot easily be accounted for by a single lesion in the nervous system.

Case Record

A man aged 32, a stone sawyer by trade, was admitted to the sanatorium in January, 1936 with a history of twelve months cough and a recent haemoptysis also that he was subject to epileptic fits.

History.—As a child he does not recollect any ill health. He joined the Army in 1919 and served until 1926. Most of this time was spent abroad first in Egypt, later in India. In 1920 he was in hospital for a brief period with a vague illness, which took the form of pains in the right side of the body. In 1922, 1924, and 1925 he believes he had slight attacks of malaria. In November, 1926 without previous warning he suddenly became dizzy and fainted but soon recovered. After a fortnight's interval he had a similar attack and at irregular intervals until the present time he has been subject to recurring seizures. At first there was usually a seven-day to ten-day interval between the fits. Latterly this was increased to as long as two to four months. Subsequent fits started with twitching in the right foot and right leg and often affected the right arm and right side of the face. Consciousness though temporarily dulled has never been quite lost. He has fallen but has never hurt himself. The tongue has not been bitten and there has been no

loss of sphincter control. Each convulsion continues for a varying period, generally five to fifteen minutes, the maximal duration being four hours. Headache, often severe with some mental dullness, remains for one to seven days after each attack.

In 1932 he began to lose power in the right side of the body, particularly following attacks, recovering only partially in the intervals between. Prior to admission he had been examined in a general hospital on five separate occasions and once in a special hospital. Complete examination of the central nervous system, including ventriculography, had failed to indicate the nature of the lesion, and radiographs of the skull appeared normal. No definite diagnosis was made; disseminated sclerosis and cerebral neoplasm having been put forward as tentative diagnoses.

Examination—Respiratory System. Signs indicative of pulmonary tuberculosis were found in the right apex. The purulent sputum showed tubercle bacilli. A radiograph of the lungs confirmed tuberculous infiltration of the right upper and middle zones, and showed scanty mid zone infiltration on the left side.

Nervous System. Memory good; can give a clear and concise history. Horizontal nystagmus present. Cranial nerves nothing abnormal. All arm movements are slightly weaker on the right side. Co-ordination is good, and there are no tremors. All sensory functions—that is, touch, pain, temperature, position, recognition of objects, weight and vibration—are present in both arms but are diminished on the right side. Tendon reflexes on the right side are all exaggerated. The right leg is weaker than the left, and the right tendon reflexes greater. The right sensory functions are diminished. Superficial reflexes abdominal present but the left weaker than the right, cremasters present, plantars—plantar flexion. During or following a fit the plantar reflex on the right side has been found to give an extensor response. Nothing else abnormal was observed.

A radiograph of the chest showed four small oval calcified opacities 4 mm long and 1-2 mm wide in the soft tissues on each side of the neck. The nature of these was not at first suspected. To discover if more were present elsewhere a film of the abdomen was taken. This at once cleared up the diagnosis. Subsequent films of the limbs and the skull have been taken and the film reproduced will speak for itself: the calcified cysticerci being clearly demonstrated. There was no history of tapeworm infection in this case.

Commentary

Cases of this nature are undoubtedly a great rarity but it is important to bear in mind the possibility of cysticercus infection in "difficult" nerve cases.

1 The onset of fits often Jacksonian in type in an adult and extending over a period of years—no obvious cause being found—is suggestive.

2 The clear history of residence abroad is important, but cases are described in those who have never left the country. A prolonged latent period may occur between infection and symptomatic or clinical manifestation.

3 Palpable recurring subcutaneous or intramuscular cysts sometimes a feature of this disease, have never been demonstrable in this case.

4 Once calcification has occurred radiological examination of the muscular and soft tissues is necessary if suspicion of the disease is aroused as radiographs of the skull are of negative value. Calcification of brain cysticerci occurring with extreme rarity.

On examination of the skull radiograph in this case one opacity appears to be in the masseter muscle. If the

calcified deposits are scanty or doubtful these can be excised and examined microscopically for hooklets.

Prognosis.—This is generally stated to be uncertain. Mental deterioration is to be looked for, though in this case, with symptoms since 1926, mental efficiency would appear to be normal.

Treatment.—This is purely symptomatic, and surgery has no place in treatment.

"Mixed Tumour" of the Lip

(WITH SPECIAL PLATE)

A man aged 49 had for twelve years a slowly growing painless swelling of the upper lip, which first appeared after a blow from the starting handle of a motor, which knocked out four teeth but did not cut the lip.

There was a visible protrusion of the right side of the upper lip. Eversion of the lip revealed a hemispheroidal tumour with a maximum diameter of about an inch having a flat surface on its inner aspect which was normally in contact with the maxilla. The mucosa over this surface was white and adherent to the tumour but apart from this attachment the tumour moved freely within the lip. At the periphery of the tumour several prominent vessels passing into it were visible. The tumour was uniformly firm in consistency. Its appearance when the lip was everted is shown in the photograph (Plate Fig. 1). The tumour was excised with the overlying attached mucosa.

Specimen.—A hemispheroidal tumour of diameters 2.5 cm and 1.5 cm. It is firm and encapsulated. The cut surface is smooth, opaque and white except for a central area which is brownish. Microscopically the tumour consists of a fibro myxomatous stroma in which are set groups of cells for the most part arranged in well formed acini containing pink staining material (Fig. 2). The acini occur singly and also in closely packed groups. At the periphery of the tumour, but without its capsule is a group of acini composed of larger cells and resembling a normal mucous gland. Mucicarmine shows the presence of intracellular mucin (Fig. 3). In the centre of the tumour there is much pigmentation, giving the Prussian blue reaction. The tumour belongs to the so-called "mixed" group that occurs in the salivary glands and other situations.

COMMENT

The lip is one of the rarest sites for mixed tumours but the occurrence of this rarity has long been recognized. Sir James Paget (1870) described a case that is almost identical with that reported here. It was 'that of a healthy looking man, some years ago under the care of Mr Lloyd. A tumour had been growing in his upper lip for twelve years. It was not painful but the protrusion of the lip was inconvenient and ugly, the swelling being an inch in diameter. It was embedded in the substance of the lip both skin and mucous membrane being tensely stretched over it. Its form was nearly hemispherical, its posterior surface being flattened as it lay close on the gums and teeth its anterior convex and smooth. Its whole substance was firm, tense and elastic. Mr Lloyd removed the tumour with the mucous membrane over it, leaving the skin entire. The tumour was firm, slightly lobed, yellowish white, smooth. In general aspect it resembled the mixed tumours over the parotid but in minute structure it presented as perfect an imitation of lobulated or acinous gland structure as any mammary glandular tumour. I heard some months afterwards that another tumour was growing in the same

lip but the patient was lost sight of. An earlier case, probably of the same kind, was reported by Sir W. Lawrence (1832). He removed a tumour from the lip of a young lady of 19. Its substance was whitish, compact, tough and almost of cartilaginous firmness, resisting the knife so as to cut with some noise.

Since that time many such cases have been reported. Ahlbom (1935), in his exhaustive monograph 'Mucous and Salivary-gland Tumours' has collected cases of his own and other authors. His figures and those quoted from other sources give an idea of the frequency of these tumours in the lip. In Ahlbom's 254 cases of mucous- and salivary-gland tumour there were two in the lip. In 422 cases reported by Ahlbom, Wood, Schreiner and Mattick, and Patey there were eight examples in the lip. These tumours of the lip are generally thought to originate in the labial glands in the lateral portion of the sub-mucosa of the upper lip.

Precipitate Labour

From time to time unusual obstetrical cases are recounted in the *Journal* and the following case, having a number of points of interest, appears to be worth recording.

A married woman aged 35 who had borne two children the first twelve years ago and the second three years ago consulted me in October last about palpitation and debility. There was a very slight enlargement of the thyroid gland and just a perceptible degree of exophthalmos. The pulse rate was 100. She stated that her periods had been in abeyance for some five or six months, but at once added that she was satisfied she was not pregnant as no increase in girth or any other symptoms had shown.

She came to see me again twice before the year ended and it was evident that her symptoms of hyperthyroidism were improving. She made no further reference to the missed periods and I confess that aspect of the condition was not kept in my mind.

Early in January one midnight I had a telephone message to come to her as she had had a baby which the person delivering the message believed was dead. I found that she had gone to bed in her usual health and at 11.30 had wakened with a colicky pain and hurried to the water closet feeling that she was going to have diarrhoea. She had a bearing-down feeling and the baby was forthwith delivered into the pan of the closet. She got up quickly scarcely knowing what had happened. The cord snapped (about its middle part) as she rose. Then only did she realize that she had delivered herself of a child. She was able to lift the infant out of the pan lay it on the floor and stagger along the passage to her bedroom. She woke her husband and told him what had occurred then she rubbed her eyes and said 'Have I been dreaming?' She was unable to believe that what had happened was real.

When I arrived she was not losing any blood and the placenta was ready for expulsion. This was approximately one hour after the birth. On the bathroom floor still lay the little cold baby but it was breathing and indeed crying, and had suffered no injury from its precipitate delivery. There had been no bleeding from the torn cord. The child was a female its weight was 5½ lb. Both mother and child did well.

The mother assured me she had never for one moment considered she was pregnant and the birth was to her as astonishing as it was to her husband and to myself.

Reviews

BIOCHEMISTRY AND METABOLISM

An Introduction to Comparative Bio-Chemistry By Ernest Baldwin, B.A., Ph.D. Foreword by Sir F. Gowland Hopkins, F.R.S. (Pp. 112 illustrated 5s net.) London: Cambridge University Press, 1937.
The Metabolism of Living Tissues By Eric Holmes, M.A., M.D. Foreword by Sir F. Gowland Hopkins, F.R.S. (Pp. 235 7s 6d net.) London: Cambridge University Press, 1937.

Comparative biochemistry has not hitherto appeared as a textbook subject. Such material as might be regarded as constituting this branch of biochemistry has been scattered in highly diffuse form through the literature of the various biological sciences. Dr Baldwin has collected and marshalled the more important and fundamental matter and presented it in a little volume which reads more like a fascinating story than a textbook. It is chiefly concerned with the relationship of the organism to its environment. Adaptation and evolution are shown to depend upon the development of special regulatory mechanisms to govern such closely interrelated phenomena as osmotic pressure, ionic equilibrium, excretion, and respiration. The several mechanisms are discussed in turn, with a wealth of illustration drawn largely from the lower forms of animal life. If special reference is made to the lower rather than to the higher animals this leaning is justified if only because the biochemistry of the former opens up what is, to the average student, a completely new territory, and the book gains considerably in interest accordingly. How few of those who are well informed on such subjects as the excretion of nitrogen and uraemia in man have ever heard of the physiological uraemia of the marine elasmobranchs! The comparative study is not only the youngest but also the most fundamental of the branches of biochemistry, and therefore such a simple, lucid, and stimulating presentation as is offered in the present volume can be thoroughly recommended to the attention of students beginning their biochemical studies. They are bound to acquire from it an interest in the subject which will carry them on to a deeper study of both this and other branches. Among those who in addition to the present-day student will find the volume of absorbing interest are members of an older generation whose approach to biochemistry was directed on entirely different lines and those of a wider public who take a general interest in fundamental scientific problems.

The Metabolism of Living Tissues by Dr Eric Holmes, is a companion volume to that which has been reviewed above. Both are written by distinguished members of Sir F. Gowland Hopkins's staff at Cambridge. They have been prepared simultaneously and have a complementary relationship. In this, the larger book biochemical concepts such as are made use of in the other are explained in fuller detail, and while the comparative branch is essentially devoted to the metabolism of the lower animals the present volume is chiefly based upon the results obtained by the investigation of mammalian tissues. The book covers a large field in fundamental biochemistry, but the treatment of subjects contrasts markedly with that of the usual textbook in which sections devoted to the chemistry of the biologically important substances are separated from and precede, discussion of metabolic problems. Here such pure chemistry as is germane to the subject is suitably woven into the text and in such a way as to put the emphasis upon the dynamic side of the activity of the

living tissues. Special attention is given to the discoveries achieved by recourse to the "tissue slice" technique, which has contributed so largely to our understanding of the metabolic changes taking place in individual tissues, especially the liver, but also the kidney, muscle, and nervous system. The book is exceedingly well written in clear easy flowing style maintaining a continuity which makes it a pleasure to read right through at one sitting even while recognizing that most sections will require much closer study afterwards. This particularly applies to those parts which deal with recent discoveries responsible for a complete reorientation of ideas. The newly established mechanism of the synthesis of urea is but one of a number of examples that might be quoted. Beginners especially will appreciate the inclusion of brief explanations of the nature of the actual methods of investigation, in that they contribute considerably to an intelligent understanding of the work of the specialist. The only critical comment that might be made is that towards the close of the chapter on the nervous system a number of special terms are left unexplained, and that the hormones have become such a vast subject in themselves that the short chapter devoted to them suffers from the necessity of over-compression. But mention of these minor points in no way alters the general conclusion that the book represents a contribution of major importance to biochemical literature and the high commendation expressed in the foreword by Professor Hopkins will be universally endorsed.

GUIDANCE IN CHOOSING A CAREER

Handbook of Vocational Guidance By C. A. Oakley B.Sc. Ed.B. and Angus Macrae M.A. M.B. (Pp. 337 10s. 6d. net) London: University of London Press 1937

This book has been written for school teachers and others who have to advise on the choice of a career for secondary and public school children. Dr C. S. Myers in his introduction says: "The art of vocational guidance is still too immature and is in a stage of too rapid development to allow for a treatise being yet written upon its theory and practice. Nor is it a technique which can be learned from a textbook. Vocational tests and intelligence tests must be the advisers' servant; they must never be his master. The greater part of the work 'is of the nature of a book of reference consisting of notes of the chief abilities and qualities which the vocational adviser should seek to assess. The rest sets out the results of a survey of occupations undertaken by one of the authors, who approached directors or secretaries of over fifty organizations with a view to ascertaining the length of training and the psychological and physical qualities required of entrants to certain occupations, and the numbers of annual vacancies which usually occur in each occupation."

The modest almost depreciatory tone of the claims made for this book disarm criticism. But we think that price might have been found for a fuller description of the methods and tests themselves and for more guidance concerning the actual choice of tests. Perhaps also insufficient emphasis is placed upon the importance and the actual diagnosis of the emotional background of success in work. It seems to us that wider use could be made of vocational guidance as a means of discovering those children who are in need of expert medical and psychological treatment. It is not enough to know that John is unfit to be a doctor; it is more important to find out whether his unfitness is really constitutional or intellectual in origin or whether it is due to faulty emotional

habits or adjustments. It is more important still that those emotional faults should be properly treated. When further experience of vocational guidance has been obtained it will probably be found that occupations can be classified much more simply than Chapter VI of this book would suggest. Many of the intellectual physical manual, and other "dexterities" which are studied by persons engaged in vocational testing will take a subordinate place in career selection in comparison with the importance that will be accorded to emotional, social and medical factors. It is not fair however to judge a book by what it does not contain. When all is said, experience shows that a great deal of very valuable help in the choice of a career can be obtained by expert vocational guidance.

The handbook shows how important is the field of work which is opening out before those who are prepared to make a thorough study of vocational guidance. It begins with a chapter in which the need for vocational guidance is explained. Chapter II discusses the nature of intelligence and of 'special' abilities, and contains a statement of the degrees of intelligence considered to be necessary for various classes of occupations and a tabular summary of the educational standards to which students must attain before they can enter the universities etc. In Chapter III brief accounts are given of the various tests that have been and are being used for "testing" both intelligence and a number of special abilities. A short (and we feel inadequate) chapter on the technique of vocational guidance follows. Two hypothetical cases are then described in Chapter V, and the rest of the book consists of a survey of the 'occupational requirements' which are thought to be desirable for about 124 occupations suited to secondary and public school children. This chapter occupies nearly 200 pages and contains valuable information though with a good deal of repetition.

This volume should be a useful reference book for teachers, doctors and parents and others who are concerned with the choice of a career for young people.

A CONNOISSEUR OF NATURE

Traveller's Rest By Philip Gosse (Pp. 281 8s. 6d. net) London: Cassell and Co. Ltd. 1937

In the opening chapter of *Traveller's Rest* Dr Philip Gosse suggests that he and the reader should "stroll along together, calmly, unhurriedly in friendly and intimate converse, ready on the slightest pretext to stop and admire a flower to watch a beetle cross the path to mourn over a dead shrew, to listen to the song of a bird, or to sit and gaze up at the clouds or at a distant view." This sentence is an epitome of the book. Dr Gosse knows how to find 'sermons in stones, books in the running brooks and good in everything' though he would qualify the last word of the quotation by vigorously excepting the vandals and iconoclasts who are rapidly destroying the beauty and character of our countryside and the charm of our villages. The collectors of birds' eggs deservedly provoke his generous rage. He also gives a timely warning to genuine but thoughtless bird-lovers. The careless breaking or displacement of a twig may expose a carefully concealed nest to the keen sight of a bird's natural enemies; traces of human or tobacco scent may blaze the trail for a destroyer. Dr Gosse draws these conclusions from his own observations at Beaulieu where as a country practitioner before the war he ringed more than fourteen hundred birds of fifty nine different species in one season. The four chapters devoted to birds also include a charming study of bird lore, the fruit of happy researches in long forgotten books, blended

with the unwritten legends which still persist in country places. From birds the author passes to a spirited defence of coarse fishing stoutly maintaining that a tench or a perch is as handsome as a trout, and citing Confucius as an addict of the poor man's sport. Another chapter deals with Sussex saints. St Cuthman, whose memory is still cherished in the town of Steyning, and the virgin martyr, St Lewinna, whose holy remains were abducted from the church at Alfriston where they had lain for nearly four hundred years and removed to Dunkirk.

This is a delightful book, a worthy successor of *Go to the Country*. Dr Gosse is a connoisseur in the best and widest sense, who shows a generous determination to share his pleasures not only with his friends but also with the wide circle of his readers.

CONGENITAL HEART DISEASE

Atlas of Congenital Cardiac Disease By Maude E. Abbott, B.A. M.D., F.R.C.P. Canada (Pp 62 200 figs 550 dollars New York American Heart Association 1936)

No name has become more closely linked with a specialized branch of medicine than that of Dr Maude Abbott, who is an acknowledged authority on congenital heart disease. Her present work, an *Atlas of Congenital Cardiac Disease* has several claims to the attention of those interested in cardiology and the history of medicine. In the first place the author's name gives this volume the stamp of expert knowledge, secondly, it integrates a vast mass of material gathered from the literature, and by presenting a tabulated analysis of 1,000 cases of congenital heart disease gives a valuable impression of relative frequency or rarity of the various forms of congenital lesions, thirdly, the individual abnormalities are explained not only by the text on the left-hand side at each opening but also by photographs, diagrams, x rays and electrocardiograms in apposition. For the most part these illustrations are clear and apt, they relate to human morbid anatomy, and also to comparative anatomy and embryology.

Dr Abbott has adopted the classification by which all lesions incapable of producing cyanosis are grouped under acyanotic lesions, while those in which a shunt between the right and left side of the heart gives permanent cyanosis are referred to as the 'cyanotic group', those in which a shunt only produces cyanosis in certain circumstances when the relative pressures on the two sides of the heart are disturbed belong to the category of 'cyanose tardive'. This volume must be included among the few modern medical publications destined to become classics.

EXTRA-ORAL MEDICATION

Parenteral Therapy By Walton Forest Dutton M.D. and George Burt Lake M.D. (Pp 386 90 figures 34s.) London Baillière Tindall and Cox 1936

This book contains a large amount of useful information. Its scope is described by the subtitle, 'A ready reference manual of extra-oral medication for physicians, dentists, pharmacists, chemists, biologists, nurses, medical students and veterinarians'. A surprisingly large number of methods of administering drugs other than by the mouth have been devised, and these have steadily increased in popularity during recent years. Many of these methods involve somewhat complex techniques and mistakes can have extremely undesirable results. The authors have collected this varied and scattered information into a single volume. Apart from the general methods of hypodermic,

intravenous, and intraspinal injection, many other special techniques are described, such as continuous intravenous infusion, blood transfusion, pneumothorax, sclerosis of varicose veins and haemorrhoids and ionic medication. The chief methods used in each case are described fully, and the description is amplified by the free use of illustrations. These descriptions take up half the book, and the second half is occupied by a therapeutic index and by a dictionary of drugs used parenterally. These latter sections do not, however, present any strikingly original features.

The volume will be found of practical service by a wide variety of practitioners of medical and allied sciences, because it describes numerous techniques, the successful employment of which depends on accuracy in regard to detail. The prominent role assumed by the hypodermic needle in modern medicine is often a subject for comment, and it is interesting to note that this volume includes a table detailing about two dozen types and sizes of needles and their appropriate uses.

Notes on Books

It may fall to the lot of any practitioner in this country, however imperfectly qualified for so specialized an undertaking to perform a post mortem on a case either of death from natural causes or of poisoning or some other condition of medico-legal importance. To such occasional morbid anatomists Dr JOAN ROSS'S *Post mortem Appearances* (third edition H. Milford 7s 6d) is an indispensable guide. Unlike most other such works, it departs from a regional arrangement and describes the essential findings to be expected in each disease or other morbid condition, it is thus possible for the operator with any clue to the nature of the case to refresh his memory beforehand and approach the task with a knowledge of what to look for. The amount of information given is surprisingly large for so small a book, and the student engaged in the post mortem room can also benefit from its use, with the added advantage that when he detects a departure from the usual appearances he should be able to ascertain its why and wherefore by personal inquiry. We are not suggesting for one moment that reference to these pages can take the place of a sound knowledge of morbid anatomy but in so far as lack of experience can be compensated for in such a way this book provides reliable information in an easily intelligible form.

In *L'Année Thérapeutique* (Masson, 20 fr) Dr A. RAVINA has again collected the recent advances in treatment and arranged them in three groups—maladies and symptoms, methods and technique and medications. Within each group the arrangement is alphabetical and treated by an oestrin ointment is the first article, and the use of vitamin C for such conditions as herpes zoster and asthma completes the book. This is the eleventh year of issue of this useful little work and it contains a special index for the volumes covering 1931–5.

As a result of considerable hospital and private experience Mr B. A. KOPKIN has attempted, and with considerable success, the difficult task of writing a *Dental Surgery for Medical Practitioners* (H. Kimpton, 5s). The author has aimed at presenting briefly the fundamentals of dental practice and in eighteen short chapters delineates the dental conditions that cross and often darken the path of the general practitioner. The descriptions are mostly clear and sufficient, but now and then a curious word appears—for example, at page 26, *undermined* which seems to mean *underlain*. The author draws special attention to the chapter on 'gas' administration, and if he can do something to counteract the whiff of gas attitude so common among doctors he will deserve the thanks of the dental profession. He

describes also the use of local injection anaesthesia, but his list of contraindications both for gas and injection anaesthesia are so similar that the reader may wonder whether there be not a third unmentioned anaesthetic.

The book entitled *The Diary of Vaslav Nijinsky* (V Gollancz, 10s 6d) represents a translation by his wife Mme ROMOLA NIJINSKY of the great dancer's account of various incidents in his life, including his homosexual attachment to Diaghilev. The diary which was written in 1918-19 after the onset of the psychosis which has been diagnosed by psychiatrists as schizophrenia shows the characteristic features of a disordered mind such as incoherence, megalomania and delusions of persecution. The text is interspersed with portraits of Nijinsky at different stages of his career and with several of his drawings, which are similar to many of those made by subjects of schizophrenia.

In our issue of April 20, 1935 we reviewed *Oxygen and Carbon Dioxide Therapy* by Drs ARGYLL CAMPBELL and E P POULTON. These authors have now issued in pamphlet form an addendum on The Oxygen Tent and Nasal Catheter, most of which appeared in the article by Dr Poulton and Mr T W Adams in the *British Medical Journal* of March 21 1936. The pamphlet will be supplied gratis to purchasers of the book who notify the Oxford Medical Press, Amen House Warwick Square, EC4.

Preparations and Appliances

LION FORCEPS FOR HALLUX VALGUS OPERATION

Mr I S SMILLIE F.R.C.S. (Ed) (Orthopaedic Department Royal Infirmary Edinburgh) writes:

The recent controversy on the operative treatment of hallux valgus and hallux rigidus prompts me to describe an instru-

ment which will be found of service to exponents of removal of either the head of the metatarsal or the base of the phalanx. Most surgeons will confess to a certain difficulty in the control of either fragment after division of the shaft before the separation of the remaining capsular and ligamentous attachments. This forceps which consists of a

lion tooth grip set at an angle of 110° to the handles provides adequate control of either fragment. The lion grip is so arranged that the proximal teeth are set closer together than the distal teeth thus conforming to the tapering of the base of a phalanx or head of a metatarsal. Other uses will be found for it in minor orthopaedic operations on the hand and foot. The instrument was made for me by Messrs Archibald Young and Son Ltd., 57 Forrest Road Edinburgh.

NEW T-TUBE FOR DRAINAGE OF BILIARY DUCTS

Mr KENNETH MUNGOT F.R.C.S. (London W 1) writes:

There are several types of T-tube for draining the common duct most being modifications of Keir's pattern. During the last few years the indications for exploration and drainage of the biliary ducts have been greatly extended and this is now

rarely omitted in operations for cholelithiasis as soft pigment stones collections of biliary sand inspissated pus, and inflammatory debris cannot always be palpated even when present in large amounts. The T-tube I use of which an illustration is given is made to my specification by Messrs.

John Bell and Croyden Wigmore Street, London W 1. The tube is No 7 English catheter gauge, and is twenty-five inches in length. The transverse trough-shaped piece is two inches long and is fitted obliquely to the tube. The soft rubber trough is easily inserted into the incision in the common duct being securely fixed into position by stitching over it the edges of the incision in the duct by means of a few interrupted catgut sutures. The long limb of the tube is led through the abdominal wound or through a special stab wound, and is anchored to the skin margin to prevent it from being inadvertently withdrawn. By means of a glass connexion which is attached to another length of rubber tubing the bile is made to drain through into a small medicine bottle fixed to the patient's side or to the bed. Some of the bile thus collected is returned per rectum two or three times a day. I find this tube very easy to insert into the common duct and, what is more, it is easily removed after it has done its work. Provided there is no obstruction in the lower reaches of the duct there is no discharge of bile through the wound after the tube has been withdrawn.

SUPPLEMENTARY FOOD PREPARATIONS

We have received from Cow & Gate Ltd Guildford the following preparations intended chiefly for supplementary feeding of pregnant women and of infants.

Prenatalac is a milk food for ante-natal cases designed to meet the heavy demands made during the later stages of pregnancy on the maternal reserves of fat-soluble vitamins and of iron. This is a dried preparation of full-cream milk fortified by the addition per pint of reconstituted food of 250 international units of vitamin D, 2,000 international units of vitamin A and 10½ grains of iron salts. Clinical tests have shown that it is well tolerated by expectant mothers and is free from any constipatory effects.

Glucose AD is a preparation of glucose which contains 2 per cent. of calcium glycerophosphate together with 6,000 international units of vitamin A and 2,000 units of vitamin D per pound. The makers point out that an increase in sugar consumption usually involves a decrease in fat consumption, and that the presence of the fat-soluble vitamins and calcium in their preparation provides a means of giving additional sugar without disturbing the vitamin and calcium balance of the diet. The preparation is particularly recommended for the treatment of acidosis and also for a variety of conditions where it is desirable to provide increased sugar intake without reducing the vitamin intake—for example pre-natal dietary lactation infant feeding and convalescence.

Cerex CG is a malted wheat food in which a considerable proportion of the starch has been converted to dextrins, malto-dextrins and maltose. The preparation is intended for use during weaning. It contains enough unaltered starch for the exercise of normal amylolytic actions, but the presence of partly digested starch renders easier the transition from milk to starch-containing foods.

INVESTIGATION OF MATERNAL MORTALITY

THE MINISTRY'S REPORTS

The Ministry of Health published last week as a White Paper¹ the long-expected report of the special inquiry into maternal mortality in England which has been carried out by medical officers of the Ministry, with Sir Comyns Berkeley's assistance in a consultative capacity, during the past two years. The areas investigated were those of forty-five authorities in which maternal mortality has been more than 5 per 1,000 live births during 1924-33, and twelve other areas with maternal death rates above the national average of 4 and also twelve areas in which they were below this average. In the course of the survey 770 deaths were inquired into. The investigators find that there are many factors in this problem which cannot be dissociated and separately assessed—there is, for example, no necessary relation between maternal mortality and housing conditions.

Local authorities, the report says, should secure proper team work between health visitors, midwives, and doctors—whether in general practice attached to hospitals or clinics, or specialists—and the Minister, Sir Kingsley Wood, is making suggestions to them for this purpose. Under the Act passed last year every mother should be able after July 1 next to have a properly qualified midwife for her confinement, and the following points are stressed. Every doctor who does midwifery cases under a local authority's scheme should be interested, experienced, and actively engaged in such work, have enough time for unhurried work, and be ready to co-operate with the local authority's own officers and others concerned in maternal welfare. Every local scheme ought to provide specialist consultants, and their services should be fully used. Lives should not be risked by taking patients to hospital when they are too ill to be moved, and the Minister is urging local authorities to arrange for 'flying squads' of skilled hospital staff to be brought to the patient in such cases.

A section of the report is devoted to abortion. Attempted abortions appear to be frequent and to be increasing and to be responsible for a number of deaths from puerperal sepsis. Mr Norman Birkett, K.C., will act as chairman of a Departmental Committee to be set up at once to inquire into the prevalence of abortion and the legal position in relation to it, and to see what can be done to reduce mortality from this cause.

Sir Kingsley Wood has recently called upon all maternity and child welfare authorities to overhaul their present arrangements so as to secure enough milk or other suitable food for women throughout pregnancy. The report suggests the need of further research into the possible influence of diet on child bearing and the Minister is in touch with the Medical Research Council on this subject. The mother herself it is insisted should take full advantage of the facilities everywhere available for ante-natal and post-natal care. Local authorities should encourage this by arranging talks and lectures, besides personal advice from doctors, midwives and health visitors. Mother and infant will be the subject of one of the main divisions of the national campaign this autumn to give wider publicity to the health services and thus encourage their fuller use.

Corresponding steps are being taken as regards Wales which is the subject of a separate report.² Summaries of the English and the Welsh reports are given below.

In his prefatory letter Sir Arthur MacNalty acknowledges the help given to the Ministry's medical officers in conducting their arduous local inquiries, in particular, he thanks representatives of local authorities, medical officers of health and members of the staffs of the public health departments, representatives of the local Branches of the British Medical Association, consultant obstetricians, and the staffs of maternity departments and hospitals, general practitioners, midwives, and representatives of voluntary agencies.

THE ENGLISH REPORT

The inquiry was instituted to try to find out why the puerperal death rate in this country has not fallen and why it has tended to remain persistently high in certain regions notwithstanding the increased interest taken in maternal welfare, the great extension of the maternity services and the remarkable improvement in the general health of the community. The trend of the puerperal death rate in England and Wales has indeed been slightly upward from 1924 to 1934. In 1935, for the first time since 1931 the rate showed a slight decrease and the provisional figure for 1936 shows a further decline.

The present investigation included visits to the areas of sixty-nine local authorities in England and statistical studies carried out in the Central Department. The field investigation was undertaken by six medical officers of the Ministry three of whom had special knowledge of maternity services and three had knowledge of health work in general. The services of Sir Comyns Berkeley were secured to assist with his counsel and advice during the investigation and in the preparation of a report.

After the visits of the Ministry's medical officers official letters were sent by the Department to each authority containing suggestions for any improvement or extension of the services which were thought to be necessary. The response has on the whole been most gratifying, and there is every reason to believe that substantial improvement in the scope and efficiency of the services in many of the areas has already taken place or is in process of being effected.

Factors Bearing on Mortality

For many years the regional distribution of puerperal mortality has been higher in Wales and the North West of England than in the country as a whole. This regional inequality is, however, not confined to maternal mortality rates, with certain exceptions the distribution of the general death rates, infant mortality, tuberculosis, and other rates show some correspondence with the rates from puerperal causes.

Caution is necessary, it is stated, in comparing the puerperal death rates of one area with those of another because the differences are those of degree only and in certain areas may depend upon relatively small differences in the number of maternal deaths. One death more or less occurring in the year under review may cause a marked rise or fall in the puerperal death rate of an area if the annual number of births is small.

Apart from the more specific causes of death other factors which might possibly have an influence on puerperal mortality were considered, such as social environment and economic circumstances, occupation, housing and overcrowding, diet and nutrition, age and parity, epidemiological associations and the climatic conditions prevalent in the districts. With regard to housing and economic conditions the available evidence on the effects of bad housing and overcrowding on puerperal mortality shows that districts in which there are areas with bad housing and overcrowding are just as likely to have low rates of puerperal mortality as those in which the housing is good and the overcrowding less. In the districts visited it was not generally found that the puerperal death rates were higher in the areas with most overcrowding.

¹ Cmd 5422 H.M. Stationery Office (5s 6d)
² Cmd 5423 H.M. Stationery Office (2s 6d)

Economic conditions, judged by the extent of unemployment, indicated that the observed variations in the puerperal mortality do not show any consistent association with corresponding variations in economic conditions. Many of the districts with high average puerperal death rates have an unfortunate social history, and it appears probable that the living and working conditions had a prejudicial effect on the physique of the people which may not yet have been entirely eradicated. On the other hand, the rural areas in the North which have tended to have higher rates than the average, show no such distinctive features. It appears to be the collective influence of many factors which predisposes towards puerperal mortality, and the effects of individual factors cannot be dissociated and separately assessed.

Nutrition of Pregnant Women

Assessment of the nutritional state of pregnant women was beyond the scope of the investigation, but the views of competent persons acquainted with local conditions were obtained by the investigating officers. In the exacting conditions peculiar to childbearing it is important to maintain the general health and powers of resistance of the mother. As adequate amounts of suitable food are essential for the metabolic functions of the mother and also for proper development of the foetus, the dietary of the pregnant woman is a matter for serious consideration. It appears that malnutrition of pregnant women due to an insufficient quantity of food is rare in the areas visited. Machinery of one kind or another is available throughout the country to supplement the dietary of expectant and nursing mothers medically certified to require it. Failure to obtain the additional nourishment by those who require it may be due either to faulty administration or to hesitation on the part of the women themselves to apply for this form of assistance. There is no doubt however that unbalanced diets are common and that the dietary of many expectant mothers is inconsistent with that now recommended by physiologists as desirable for pregnant women. The influence of the nature of the dietary and of nutrition on maternal mortality cannot, it is observed, be accurately assessed in the present state of knowledge.

Data relating to the age and parity of childbearing women were collected during the course of the investigation and also by Dr Percy Stocks of the General Register Office and from a study of these the risk of death is shown to increase steadily with advancing age. The risk at the first is apparently greater than in succeeding confinements until the eighth and the third confinement appears to carry the least risk.

The national figures show a close correspondence over long periods between puerperal sepsis and other septic infections of similar origin such as scarlet fever and erysipelas but closer study in the areas investigated seemed to indicate that the association has no causal significance.

Possible Climatic Influences

The geographical distribution of the incidence of puerperal mortality in England—namely the tendency for the death rates to be higher in the north and west and lower in the south and east of the country—suggested that climatic conditions might in part exert an influence. There may be an association between climatic factors such as sunshine, temperature, and humidity and the incidence of puerperal mortality. Thus there is some indication that abundant sunshine tends to be associated with a low rate of puerperal mortality but the data required to demonstrate the association are not complete.

Deaths from puerperal sepsis tend to occur most frequently in the coldest quarter of the year that being the quarter which immediately succeeds the wettest and most sunless quarter while deaths from toxæmia tend to occur in the warmest quarter that being the one which immediately succeeds the driest and sunniest quarter and

precedes the quarter in which the rainfall is highest. In the present state of knowledge it is impossible to assess the significance of this association.

Artificial Abortion

In each area visited endeavour was made to obtain information regarding the prevalence of abortion. The circumstances associated with the deaths due to abortion which occurred during 1934 were also investigated, and are clinically analysed. The figures obtained from the Registrar General's Department also formed the subject of statistical studies.

Although it was not found practicable to estimate the effects on health resulting either from abortion or from attempts to induce abortion, frequent assertions were made by persons interviewed that women became debilitated or anaemic or were in general ill-health as a result of the repeated and prolonged use of aperients and other drugs taken with the object of terminating pregnancy. Quotations from recent literature cited in the report indicate that the effects of artificially induced abortion may be far reaching. From the information obtained it seems evident that the practice of artificially induced abortion is frequent appears to be increasing is more prevalent in some districts than in others, and is not restricted to any one social class.

Abortion (whether spontaneous or artificially induced) is an important factor in the puerperal death rate of the country since approximately 14 per cent of all puerperal deaths are due to this cause (excluding deaths from abortion classed as criminal). The puerperal mortality rate includes deaths due to abortion and the puerperal mortality rates of England and Wales, which during the years 1933, 1934, and 1935 were 4.51, 4.6 and 4.1 respectively, would have been reduced to 3.86, 3.94, and 3.51 if the deaths due to abortion had been excluded.

The risk attending artificially induced abortion does not, it is found appear to be sufficiently realized, and there is urgent need for the education of women respecting the damage to health and the danger to life from attempts to terminate pregnancy artificially. The facilities available in some areas for the inpatient treatment of cases of abortion under expert supervision are inadequate.

Local Study of Maternal Deaths

Local investigation of all maternal deaths which occurred during 1934 in the areas visited was undertaken, and these amounted to over one-quarter of the total puerperal deaths in England during that year. An endeavour was made to discover whether any fresh light could be thrown on the problem of maternal mortality by intensive local study of the conditions associated with the deaths and to ascertain if any circumstances peculiar to the district in which the women died might have contributed to the fatal issue. Consideration was given to the possible influence of environment attention was directed to the conduct of each phase of childbearing, the local facilities available for professional assistance and for inpatient treatment were assessed and the conclusions arrived at are based on the evidence so obtained.

The main findings of the present investigators do not differ from those of the Departmental Committee on Maternal Mortality or from those of the officers responsible for the report of the Department of Health for Scotland issued in 1935. They indicate that in many instances ignorance or lack of co-operation on the part of the patient or her relatives prejudiced her chance of recovery and they illustrate afresh it is said that there is need for more systematic and careful medical supervision during the antenatal period more skilful management of some confinements more frequent reference of cases of doubt or difficulty for the advice and treatment of an expert obstetrician, and earlier admission to hospital of many patients.

Local Maternity Services

The report gives an outline of an efficient maternity service of a local authority and includes subjects recommended for consideration, in order to render the services more fully effective. A comprehensive survey of the services was undertaken in every area visited, and attention is drawn to the directions in which they fell short of the standard of efficiency outlined. The maternity services provided by local authorities have, it is stated, been greatly extended and improved during recent years. Immediate results must not be looked for, time is necessary before new or extended provisions can exert their full measure of usefulness. Attention must not be focused only on the women who die, regard must be had to those whose lives are saved. It should be borne in mind that the services provided by a local authority do not operate alone but in conjunction with those of voluntary organizations, independent agencies, and private professional attendants. There are also other factors—such as abortion—which may influence the puerperal death rate. Criticism is sometimes made of the disappointing results achieved by ante-natal supervision, but allowance is not always made, the report points out, for the fact that general recognition of the value of such supervision is of relatively recent date. The underlying principles of ante-natal care are sound, but optimal results cannot be expected until ante-natal supervision attains a high general standard of efficiency and expectant mothers make full and intelligent use of the facilities provided to safeguard their health. The development of consultative ante-natal clinic sessions, under the clinical supervision of an expert obstetrician to serve every area is of importance in order to render ante-natal services more efficient.

Changing Midwifery

The position as regards midwifery has undergone profound changes in recent years. Apart from the diminution in the number of births due to the fall in the birth rate there has been a decrease in the number of domiciliary confinements conducted by general practitioners and an increase in those for which midwives are responsible. There has also been a rapid and increasing development of institutional midwifery in many districts. The foundation of a sound midwives' service has been laid by the Midwives Act 1936 which provides for the establishment of an adequate service of salaried midwives in the area of each local supervising authority for attendance on women in their own homes either as midwives or maternity nurses. This is a legislative measure of great potential value as opportunity now offers to secure well-trained midwives and to maintain their work at a high standard of efficiency. The importance of sympathetic and skilful supervision of midwives is emphasized. Under the new Act the Minister of Health is empowered to make regulations prescribing the qualifications of persons appointed by an authority to exercise supervision over midwives practising within its area and no person is to be appointed in future whose qualifications are not in accordance with the regulations.

The General Practitioner's Task

It was evident during the investigation the report says that many medical practitioners undertake a considerable amount of obstetric work with competence and skill. The midwifery practice of some doctors has, however, decreased, and the position in some towns is that, unless a general practitioner has a special interest in midwifery or is of repute for his obstetric skill his maternity practice may be largely restricted to a few medical aid calls from midwives in the course of a year. The general practitioner is often called to an emergency in the patient's home and may have to cope without adequate assistance and in unfavourable surroundings with critical situations which would challenge the skill of an obstetric specialist. Other calls upon his time may be pressing. Moreover the condition of the patient may be such as to compel

him to take immediate action, however disadvantageous the circumstances may be. The histories of many of the maternal deaths investigated indicated that, notwithstanding these handicaps, careful obstetric procedures were adopted, but others show that the woman's chance of recovery would often have been enhanced had a practitioner experienced in midwifery been in attendance had the doctor been assisted by an obstetric expert, or had the patient been admitted to hospital sufficiently early.

A midwife is required by the rules of the Central Midwives Board to call in a medical practitioner in all cases of illness of the patient or of the child, or of any abnormality occurring during pregnancy, labour or lying in. She is required when possible to call in the doctor desired by the patient or by the responsible representative of the family, and, although under the Midwives Act 1918 local supervising authorities are required to pay the fees of all doctors so called in, they have no voice in the selection. A doctor whose practice of midwifery is restricted to only a few cases each year cannot be expected to assist the midwife in difficulties which may urgently call for judgement and experience which, in the circumstances, he cannot be expected to possess. It is suggested in the report that the local supervising authority, in consultation with the local medical profession, should in future be empowered to take steps to ensure that the best local obstetric skill is made available in all cases in which midwives are required under the rules of the Central Midwives Board to call in a doctor.

Hospital Provision

Although extensions have taken place in the provision of hospital facilities for maternity patients, in some districts the demand for beds has exceeded the number available. Much of the accommodation in the hospitals visited was not designed for the purpose, and in a number of districts complicated maternity cases had to be admitted in emergency to general hospitals, in some of which obstetric practice was not regarded as within the scope of their normal activities and the services of obstetric specialists were not always available. Properly constructed adequately equipped, and suitably staffed maternity accommodation including a sufficient number of beds allocated to and reserved for ante-natal patients, should be provided to meet the needs of every area.

It is recognized that the treatment of puerperal sepsis patients in hospital is almost always desirable, and satisfactory arrangements should be made for their accommodation. The treatment of these patients should be carried out under the direction of an expert obstetrician.

Need for Post-natal Care

A considerable proportion of the gynaecological conditions from which women suffer are attributable to the report states, to the effects of childbearing. Specialist advice and facilities for in-patient treatment should be available and instruction and education of the mothers in the importance of submitting themselves for medical examination after confinement should form part of every post-natal scheme. There is need for the fuller development of post-natal services throughout the country, as it is clear that the value of post-natal care is not yet sufficiently appreciated. The existence of such facilities should be made widely known.

Many authorities have provided a full range of auxiliary services, but that of others was lacking in some particulars. Arrangements for the provision of extra nourishment were in some cases not sufficiently comprehensive. Some dental schemes were incomplete and the value of the services of home helps for women who are incapacitated during childbearing was not always sufficiently realized.

Consultant Facilities

Stress is laid on the importance of the provision of a service of obstetric consultants and attention is drawn to the infrequency with which the consultant facilities were

utilized in some areas in which they had been provided. The duties of a consultant, under the administrative supervision of the medical officer of health should, wherever practicable include the rendering of assistance to general practitioners in domiciliary cases of doubt or difficulty during pregnancy, at the time of confinement, or in the puerperium. The specialist should attend consultative ante-natal clinics not only to advise on appropriate methods of treatment, but to take steps to ensure, as far as circumstances permit, that patients for whom hospital treatment is indicated, whether during pregnancy or at the time of confinement, may be admitted to the maternity unit under his charge. He should be placed in clinical charge of the maternity department for the area and of the puerperal sepsis unit, and should attend post-natal consultative clinic sessions.

The practice of medicine comprises many branches each of which is tending to become more specialized but this development the report states, has been slower in the obstetrical than in the other departments of medicine and surgery. It should be realized, both by the public and by the medical profession that reference of cases in which there is doubt or difficulty for expert advice and treatment is not a sign of failure or incompetence on the part of the medical attendant. Women who develop serious illness during pregnancy or in whom some abnormal condition is detected which is likely to complicate delivery should be referred early for the opinion of an expert and where necessary, be admitted to hospital in time for skilled treatment to be effective.

Emergency Units

Among the deaths investigated attention was directed to the number of instances in which women were admitted to hospital in a moribund or in an exsanguinated condition. In cases of grave emergency, such as haemorrhage, shock or eclampsia, the services of members of the skilled staff of a maternity department should be brought to the patient instead of subjecting her to the risk of transport to hospital. The provision of so-called emergency units of flying squads in connexion with a maternity department under the direction of an expert obstetrician, should effect a reduction in maternal mortality.

Interchange of Information

Attention is directed to the importance of adequate record keeping and to the need for interchange of information between all those concerned. Full and careful records would afford valuable information respecting the local incidence of normal childbearing, slight deviations from the normal and serious abnormalities. If these records were tabulated on a uniform basis it would assist those responsible for a maternity scheme to assess its efficiency and to detect defects of administration, practice or co-ordination and would afford a means of comparison of the different services and of the varying incidence of morbidity throughout the country. Reference is made to the inadequacy of available information regarding maternal morbidity. In any endeavour to ascertain why the puerperal mortality rates in some areas are higher than those in others the incidence of the illnesses of pregnancy and the complications of childbirth would be a more reliable guide than the certified causes of death.

Team Work Essential

It is essential to the success of a maternity scheme the report continues that there should be co-operation between all those concerned and although this was a satisfactory feature in a few of the areas visited in others its importance had not been recognized. The services which were closely co-ordinated with maternity units staffed by resident obstetric officers working under the supervision of consultants and in association with consultative ante-natal and post-natal clinics and where co-operation between the workers had been secured were those in which the best results appeared to have been

attained. The time for independent individual effort is past. All persons engaged in any branch of a maternity service should consider themselves to be members of a team working towards the goal of safer motherhood. In this way and this way alone can effective continuity of supervision and treatment be secured.

The number of maternal deaths is small compared with that from many other causes of death and does not amount to 8 per cent of the total deaths for all causes among women of childbearing age. The puerperal mortality rate is not a true indication of the risk of motherhood, it overstates the hazard to life. It is calculated on the number of births yet it includes deaths due to abortion and those which occur prior to the birth of a child. There are many factors which influence maternal mortality the effects of which cannot be separately assessed. Maternal deaths occur which in the present stage of knowledge cannot be averted. In some cases lack of co-operation on the part of the women themselves influenced the issue.

When due allowance is made for these factors the report regards it as certain that the maternal mortality rate of this country is capable of reduction, and that of the factors known to influence this rate the most important from the point of view of remedial action is the standard of midwifery practice.

Main Recommendations

The recommendations made by the Departmental Committee on Maternal Mortality in respect of the training of medical students have been implemented, the maternity services of local authorities have undergone and are undergoing substantial developments, the provision of a service of salaried midwives throughout the country has become a statutory obligation as a result of the passing of the Midwives Act, 1936, but the role of the general practitioner in midwifery has not yet received the attention it deserves. Hence the outstanding recommendations contained in this report are those designed to improve the standard of obstetrics—namely:

- 1 The establishment in each area under the direction of the medical officer of health of an adequate service of obstetric consultants to undertake the duties to which reference has already been made.
- 2 The provision of emergency units whereby the members of the staffs of the maternity departments will be available for the domiciliary treatment of maternity patients whose condition is too grave to justify removal to hospital.
- 3 Arrangements by which the local supervising authority in consultation with the local medical profession shall in future be empowered to take steps to ensure that the best local obstetric skill is made available in all cases in which midwives are required to call in a doctor under the rules of the Central Midwives Board.
- 4 The provision of properly constructed adequately equipped and suitably staffed maternity accommodation including a sufficient number of beds allocated to and reserved for ante-natal patients to meet the needs of every area.

The other recommendations deal with the provision of ante-natal clinics including consultative sessions, home help schemes and fuller domiciliary visiting of expectant mothers. The development of post-natal services, education of women and of the public in the need for co-operation with those responsible for maternal welfare, and arrangements to ensure that expectant and nursing mothers in need of extra nourishment shall receive it, are also included.

Special subjects requiring further study are suggested such as research with a view to the discovery of a reliable prophylactic treatment for puerperal sepsis, abortion with special reference to the influence it may exert on maternal mortality and morbidity and future childbearing and further research into the possible influence of the dietary upon childbearing.

THE WELSH REPORT

The causes of high maternal mortality in Wales have been the subject of close investigations by medical officers of the Welsh Board of Health. For the purpose of the inquiry every part of Wales was visited, and recognition is made in the Welsh report of the help given by the local authorities, doctors, nursing associations and others. The statistics of maternal mortality for the ten years 1924-33 are examined in detail.

In several ways Wales presents an interesting field for comparative social study. Industrially, in economic circumstances, and in the geographical distribution of population, two extremes in type of area exist. In the South Wales coalfield highly industrialized conditions predominate, and the large seaport towns are also commercial centres, engaged in considerable foreign trade. Most of the rest of Wales is rural in character and sparsely populated and conditions have not greatly changed in the last generation.

Industrial and Rural Areas

While in rural Wales the women marry at later ages, the number of births per married woman is higher in rural than in industrial areas at all childbearing ages. The illegitimate birth rate is roughly twice as high in the rural as in the industrial parts. Both in industrial and in rural Wales the risk of maternal death, stillbirth, and the death of young infants increases with the age of the mother, and is higher for first pregnancies than for succeeding childbirths, but the variations in all cases are shown to be less in rural than in urban areas.

Procured abortion, the report states, is believed to be common in South Wales and to have increased in recent years, but is infrequent in the rural districts. The mortality from puerperal sepsis also is lower in rural Wales. Otherwise no important variations are exhibited in the maternal death rates for the different classes of district. In all parts of Wales, in industrial and rural areas alike, the death rate is comparatively high. It has decreased in the county boroughs but an increase has occurred in almost every other industrial area.

The Problem in Perspective

While, relative to England, the maternal death rate is high in Wales, the report points out that the number of deaths each year due to childbearing is small in comparison with the number of deaths of a more or less preventable nature from other groups of causes. A mortality rate of 5 per 1,000 births has its opposite in the fact that in 995 cases out of every 1,000 the woman survives pregnancy. The causes for concern are that deaths of a preventable nature occur.

General Ill-health

There is reason to believe that ill-health and disability among many women in Wales accounts in some measure for the high death rate among mothers in childbirth. It is of special significance that maternal mortality is highest in those regions of England which show high death rates from all other causes among women of childbearing age and lowest in those regions where the general death rate is lowest. Both the maternal death rate and the death rate from all other causes are higher in Wales than in any English region.

The investigators state that a good deal of the ill health among mothers is due to ignorance, carelessness and neglect, and that the remedy for this state of affairs lies largely in their own hands, helped by the sympathetic work of health authorities. Emphasis is laid upon this point as care and attention by the woman herself during pregnancy is considered possibly as important in reducing the high maternal mortality rate as is the provision of extensive maternity services. Co-operation of the mother with her attendants and advisers at all stages in all measures which will help to a safe delivery is most desirable. Careful attention to personal hygiene and a readiness to put her-

self under medical supervision and treatment will prevent the occurrence of many difficulties which may prejudice the chances of successful childbirth.

Measures to Reduce Maternal Mortality

In measures to reduce the loss of life from childbirth much of which could be prevented if proper measures were taken, all parties concerned—the mother, the doctor, the nurse, the local authorities, and the State—have their respective functions. First there must be a recognition of the importance of sound general health. Childbirth is normally a safe and natural event, and women should be encouraged to look upon childbearing in that light. The right attitude of mind, however, comes more easily when the woman is healthy and realizes her responsibilities and the home surroundings are good. Ante natal attention should be wisely directed and the confinement should be in trained hands. Adequate ante natal care is needed for the more appropriate attention during pregnancy than less likely will there be unfavourable results at childbirth.

Parliament, it is observed, has given to the local authorities wide powers in regard to public health, and there has been growing acceptance of the importance of maternity in the development of the health services. The efficiency of the provision made for maternity must depend largely on local initiative and supervision, and the intelligent use by the woman of the services available. The services should be well thought out and widely utilized, schemes framed and administered at great cost can yet be wasteful in result.

Public opinion is fully alive to the gravity of the problem but there is not always a true appreciation of the real nature and extent of the problem or of the difficulties. Many deaths occur from other causes than pregnancy or childbirth which in the present state of knowledge can be classed as avoidable. It may confidently be hoped the investigators state, that with a wider recognition of the principles of preventive medicine in maternal welfare work there will come a progressive reduction in maternal mortality and morbidity and a greater saving of child life.

Maternity Services of Local Authorities

Recommendations are made for improving the standard of the maternity services. At present the services provided by most of the local authorities are inadequate and outside industrial South Wales and Flintshire very little maternity work is undertaken either during the ante natal period or at the confinement. The report recommends that every local authority should organize and provide an efficient and complete maternity service which should be available to every mother. The essentials of a good service are considered to be:

- (i) A sufficient supply of competent midwives
- (ii) Skilled medical attention which should reach every mother during pregnancy, labour and the puerperium
- (iii) The provision of hospital beds for those women requiring them either on account of abnormality at any stage or because of unsuitable home conditions

Under the scheme as outlined the general health of the mother, her education in motherhood, the problem of help in the home, the provision of extra nourishment and all affairs relating to the pregnancy would be under the supervision of one or other branch of the authority's maternity service. The arrangements in rural areas would necessarily be different from those in populous areas.

The Minister of Health is immediately in conjunction with the Welsh Board of Health, urging upon all authorities in Wales that they should consider the essential requirements of a complete scheme of maternity services including ante natal and post natal supervision and should pay special attention to securing proper team work, the provision of additional maternity accommodation, of obstetric consultants, of emergency units for bringing skilled services to the patient, and the organization of general educational teaching.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY MAY 8 1937

MATERNITY SERVICES

Valuable as it is in many important respects, the report on an investigation into maternal mortality issued last week by the Ministry of Health contains both a disappointment and a danger. We print in this issue (p. 972) a summary of the report and its main recommendations, and, in the *Supplement*, a memorandum which has been approved by the Council of the British Medical Association and is to be submitted to the Representative Body in July.

The valuable features of the report are that it places the problem of maternal mortality in England in its proper perspective, that it discusses the general questions arising out of that problem in a careful fashion without exaggeration, and that it emphasizes the difficulty and many-sidedness of the considerations that have to be taken into account, and deprecates the loose employment of statistics and the rhetorical and misleading use of such words as "preventable" and "avoidable" in this connexion. With regard to some of the statements not infrequently made on public platforms it is well for the public to be told or reminded that though the maternal death rate has remained almost stationary of recent years it has fallen enormously when a longer period of time is considered, that the rate in this country compares favourably with that of most other countries, that maternal deaths are relatively few in number, that if the causes of death in women from 15 to 45 years of age are examined it will be found that only 7.7 per cent were due to pregnancy and labour and 92.3 per cent to other causes and that notwithstanding the hazards of childbearing the risk of death during this period as a whole is less for the married than for the single woman. It is owing to this smallness of the numbers of deaths due to maternity that variations in rates may indicate mere chance conditions and do not necessarily reflect any real variations in the underlying causes.

The disappointment in the report is that it does scarcely anything towards elucidating the problem which was understood to be the main subject of the investigation—namely the persistence of a high maternal mortality rate over a considerable number of years in certain areas, mainly in Wales and in the North West of England. It is the persistence, rather than the actual degree of such a rate, that

needs explanation, and it was hoped that if this could be found it might lead to some further steps towards the betterment of the present almost static figure. So far as the English "black areas" were concerned at any rate, it could scarcely be imagined that in them there was a lower standard of clinical obstetrics than elsewhere, or that administrative arrangements were markedly less satisfactory than in other districts, but it might well have been that, in spheres other than those of clinical practice or of administration, discernible factors were present which would account to some extent for the anomaly. There must be such factors, but they have not been found. It has once more been demonstrated that neither the standards of housing nor the economic circumstances of the household bear any definite relation to the risks of maternity. These risks are often least in unsatisfactory environments and appear to be greater among the well-to-do than among the poor. The investigators did make inquiries into certain social, industrial and climatic conditions, but beyond the suggestions that employment in textile factories and the prevalence of a rainy climate tend to be accompanied by a high maternal death rate and that there should be further inquiry as to the possible influence of dietary on childbearing, nothing very useful emerges. In the corresponding and parallel report made by the Welsh Board of Health it appears to be accepted that a relatively low standard of living, an excessive incidence of intercurrent disease, wrong feeding and poor nutrition, a somewhat high degree of ignorance, carelessness, and neglect by the mother, a high illegitimate birth rate in rural Wales, with an increase of procured abortion in the industrial areas, and inadequate administrative action on the part of a number of local authorities are sufficient to account in large part for the unduly high rate in Wales as a whole. Most of these are, fortunately, remediable defects.

The danger in the report consists in this—that the recommendations made, while some of them are welcome and not one of them is unacceptable in itself as worded, would not only leave the country with a large number of local isolated maternity services working piecemeal and on varying principles instead of a national service in which fundamental features were uniform and universal though locally administered, but would allow of interpretations and methods of implementation which would be detrimental to the medical profession and might be disastrous to the public. Two such points relate to the provision of domiciliary ante-natal supervision in some districts only instead of in all, and to the usage of maternity hospital accommodation and the nature of its

staffing The major point of principle, however, relates to the method by which steps shall be taken "to ensure that the best local obstetric skill is made available in all cases in which midwives are required to call in a doctor" This is the question to which the memorandum approved by the Council of the British Medical Association is mainly directed, and it requires the most serious attention of every member of the Representative Body, and indeed of every registered medical practitioner In the last paragraph of that memorandum the Council makes a proposal which would be effective in improving the standard of obstetrical practice in cases in which it may now be deficient, while at the same time conserving the rights and interests of the profession of the mother, and of the general public, which is largely dependent upon the training and experience of its medical attendants even if they are not included in an established social service These rights and interests are jeopardized by the alternative method which it is understood the Ministry of Health and the Central Midwives Board now have under consideration This is that the midwife should be allowed to call to her assistance such practitioners only as are selected by the local authority for this purpose By the Medical Act, 1886, a registered medical practitioner "shall be entitled to practise medicine, surgery, and midwifery in the United Kingdom", but if by administrative action on the part of the Ministry of Health and by the alteration of a rule by the Central Midwives Board three-fifths (or in some localities more than nine-tenths) of his field of midwifery practice may be forbidden him the question arises whether the doctor's statutory right has not been infringed If it is to be infringed, then this should be done by straightforward legislative action by amending the Medical Act. No doubt the General Medical Council will consider this aspect of the matter, as well as the implied criticism that medical practitioners now being registered after having completed the improved and extended midwifery course prescribed are not competent to deal with the minor emergencies for which the midwife would have to ask their help and to decide that an obstetric specialist should be called in in others

The rights and wishes of the mother are at stake At present she may have the doctor of her choice In the contemplated circumstances she would in a large number of cases, be deprived of this and even forbidden to avail herself of the services of the practitioner whose duty it had been to look after her throughout her pregnancy The interests of all classes of the public, too, would be affected A well trained and experienced medi-

cal profession is essential in these interests The problem of recruiting as well as of establishing the selected lists of permitted doctors would present itself They are to contain the names only of "experienced" doctors, yet newly qualified practitioners are to be denied the major part of the opportunity open to them for acquiring such experience It is open to question whether lists compiled by this method, and entailing such consequences, would contain the names of those likely to bring to the service the "best local obstetrical skill" It is to be hoped that the Ministry and Board may, on consideration, prefer such a plan as that proposed by the Council of the British Medical Association as likely to be more effective in practice and less inequitable

VALVULAR LESIONS IN RHEUMATIC FEVER

In the past there has been no clear-cut agreement on what are the characteristic histological changes in the cardiac valves in rheumatic fever the chief points at issue were the mode of formation of the vegetations and whether the valves were normally vascularized or not A recent paper from the laboratories of the Mount Sinai Hospital¹ deals authoritatively with these problems For many years Louis Gross and his colleagues have been studying the morbid anatomy and histology of the heart in rheumatic fever, and successive papers have appeared on the lesions of the myocardium,² blood vessels³ conduction system,⁴ and pericardium⁵, in each the same techniques have been employed and the pathological changes compared with the normal appearances at varying ages They state that the normal valve consists of a dense collagenous stroma which is covered on each side by a fibro-elastic layer, loose connective tissue, and endothelial cells, the valve leaflets are attached to the myocardium through the valve ring which is made up of a gelatinous tissue and a fibrous annulus The normal valve is markedly acellular, and blood vessels are seldom found save for a few capillaries in the valve ring

This is in direct contrast to the views on valve vascularization recently expressed by Wearn,⁶ but Gross suggests that myocardial vessels were included in the statistics, and that valves with evidence of past inflammation were regarded as normal material With advancing age the normal valve becomes thicker and more fibrotic lipid

⁴ *Ibid* 1936 12 31

⁵ *Ibid* 1936 12 183

⁶ *Amer Heart J* 1936 11 22

and calcium deposition may appear, but there is never any evidence of cellularity or vascularization. In acute rheumatism capillarization with infiltration of inflammatory cells of the valve rings occurs as a contiguity process from the inflamed myocardium, this process spreads along the valve leaflets, producing oedema and eosinophilic swelling of the fibrous tissue. Vegetations are found on all valves, but are most pronounced on the mitral and aortic cusps, the tip is not affected, but vegetations appear at the point of closure or where there is a blood eddy or stasis (the frequency of vegetations within the valve pockets is emphasized). It is suggested that the vegetations are formed by an extrusion from the valve leaflet of the swollen fibrous tissue and fusion of the proliferated cells, and that the deposition of platelets or fibrin plays very little part in their formation. In the subacute and chronic stages the valves are invariably vascularized, and there is an increasing fibrosis and distortion with secondary lipid changes and calcification. New vegetations may be formed, and these occur at the most distal portion of the valve still presenting inflammatory changes accordingly several distinct rows of vegetations arise as the increasing fibrosis and distortion exposes different portions of the valve to the blood stream. Gross and Friedberg uphold the view that the pressure to which the valve is exposed plays an important part in determining the extent of the valvular deformity, and mention the frequency with which fresh vegetations appear on the tricuspid valve in cases of pulmonary hypertension even in the absence of fresh lesions on the mitral valve. In cases of apparently inactive rheumatism large thrombotic vegetations which are not due to a bacterial endocarditis may form on the damaged valves, these are regarded as an epiphenomenon, and are usually associated with cachectic states. Although more liable to occur on damaged valves, they may arise on healthy valves and in some cases have been associated with thrombocytopenic purpura and in others with an unusual form of polyarthritis, prolonged fever and serous effusions.

The value of such careful descriptive morphology cannot be overestimated and the work of Gross and his colleagues is in the Virchow tradition. Tracing the changes throughout the heart in rheumatic fever in all its stages they have shown clearly that the valvular lesions must be regarded as an inflammatory process spreading from the myocardium with secondary vascularization of the valves and that there is no evidence to suggest that the valves are first vascularized and then involved in the rheumatic process by reason of changes around the vessels within them.

THE NUTRITIVE VALUE OF PASTEURIZED MILK

One of the statements most frequently made by opponents of pasteurization is that the nutritive value of milk is deleteriously affected as the result of treatment by heat. No satisfactory evidence in support of this contention has yet been brought forward. It is true that certain workers have carried out experiments the results of which have been regarded as favouring raw as opposed to pasteurized milk but careful examination of their protocols has usually revealed some source of error that has rendered their conclusions untrustworthy. On the other hand there have been a number of workers who have failed to find any significant difference between the nutritive value of raw and that of pasteurized milk. With the rapid increase in the extent of pasteurization that is occurring at present and the growing demand for powers of compulsory pasteurization by towns like Glasgow and Poole whose experience of raw milk has been unfortunate it is important that this question should receive a definite answer. Considerable progress towards this end is being made by a group of workers at the National Institute for Research in Dairying at Reading and the Rowett Research Institute at Aberdeen who are engaged under the auspices of the Milk Nutrition Committee of the Milk Marketing Boards in making careful observations on the comparative nutritive value of raw and pasteurized milk. The first report¹ of this committee, which has just been published mainly concerns experiments on rats. The results of further investigations—on calves and on school children—are promised for publication in the near future. Observations on the individual constituents of milk showed that when subjected to commercial pasteurization by the holder method (145°–150° F for thirty minutes) milk lost about one fifth of its vitamin C content and a certain but unmeasured amount of its vitamin B complex. No change was observed in the vitamin A or carotene content of the milk in the biological value of the proteins or in the availability of the calcium or phosphorus. The change in the vitamin B complex could be detected only when the intake of milk was limited to about 8 ccm daily. With regard to the partial destruction of vitamin C it is pointed out that pasteurization could not be held entirely responsible. The reduced form of ascorbic acid that is secreted by the normal cow is resistant to heat but is capable of reversible oxidation under the action of light. The oxidized form is susceptible to heat and it is this form resulting from exposure of the milk to light after it has left the cow that is destroyed by pasteurization. Experiments on litter mates carried out with whole milk given in a quantity of 70–80 ccm daily failed to show any difference between the nutritional value of raw and pasteurized milk as judged by such criteria as gain in weight, body length or the calcium and phosphorus content of the

¹ *Milk and Nutrition*. Part I. *The Effect of Commercial Pasteurization on the Nutritive Value of Milk as Determined by Laboratory Experiments*. The National Institute for Research in Dairying (University of Reading) and the Rowett Research Institute, Aberdeen. Pp. 309. London and San Francisco 1937 (2/6d).

carcasses Until the results of the investigations on calves and children are published it would be unwise to draw any general conclusions from the observations just reported It is of considerable interest however, that experiments so carefully carried out on rats have failed to afford any support to the contention that pasteurization destroys the nutritive value of cows' milk for these animals

HUMAN TUBERCULOSIS OF BOVINE ORIGIN

At the October meeting of the Office International d'Hygiène Publique representatives of Great Britain Germany and Holland submitted reports¹ on the incidence of human tuberculosis of bovine origin The report from Germany prepared by Professor L Lange, gives a comprehensive survey of the investigations carried out in countries all over the world, and thus contains much information not accessible easily elsewhere He concludes that there is no form of tuberculosis that may not be caused by the bovine bacillus The figures of incidence in various countries differ so greatly that international averages calculated from them would have only a limited value All that can be said is that three groups of countries can be differentiated (1) those in which the bovine bacillus is relatively insignificant—*e.g.* Japan, India, and perhaps Norway, (2) those in which there is an "average" amount of human tuberculosis due to this bacillus—among them Germany and Switzerland and (3) those in which this incidence is very high—England and Scotland There is little doubt that there is a close connexion between the incidence of the bovine type in human tuberculosis and the amount of tuberculosis in cattle in the same country Nevertheless though feeding is the most important factor it does not, according to Professor Lange explain entirely why there is so much human tuberculosis of bovine origin in England and Scotland while other countries are almost free from it Sir Weldon Dalrymple Champney's report, amplified by a note prepared by the Scottish Board of Health, summarizes the now well known investigations by Stanley Griffith W T Munro, W M Cumming and J W S Blacklock and the administrative measures that have so far been taken to reduce the incidence of disease with the bovine bacillus in man Stress is laid on the 1936 Order in regard to the designations of milk and to the importance of pasteurization In the light of Professor Lange's conclusions it appears, however that if England is not to attain an unenviable position in this connexion more energetic or perhaps different kinds of measures will have to be taken It is helpful to note that country districts show a much higher incidence than towns this is particularly striking in Scotland Finally the Dutch report contains results of the investigation of the sputum of adults in Amsterdam and South Holland and of the gastric contents of children under treatment in sanatoria Work was also carried out to compare the results obtained by different preliminary treatments of the gastric fluid and by culture and inoculation It appears that for the bovine type the best results are obtained

when the gastric contents are treated with soda rather than with acid, and when a Loewenstein medium is used which does not contain glycerol guinea pig inoculation, however is still superior to culture

TREATMENT OF PEPTIC ULCER

Some interesting though hardly encouraging results have been collected recently by Dr Sandweiss¹ in an attempt to compare the relative efficacy of diet injections, and surgery in the treatment of peptic ulcer Among 260 patients treated by alkalis and diet according to the Sippy regime immediate improvement was noted in from 72 to 94 per cent, but relapse occurred within five years in 65 to 85 per cent., and three quarters of even the most favourable cases relapsed within a period of ten years Vaccines emetine distilled water or histidine injections gave almost identical immediate results but a review at the end of one year showed that the proportion of relapses was higher than in patients treated by diet and alkalis Rest in bed with alkalis and dietetic therapy gave better five year results than injection treatment gave at the end of one year Surgical intervention in a small series of cases was even less successful Only three patients out of twenty-five operated on for peptic ulcer have remained free from symptoms the results of a total of seventy operations showed that three patients had died (8.8 per cent.) and that over 90 per cent had relapses Taking all methods of treatment together, only five patients out of 155 have remained symptom free for from five and a half to seven years after the first and only attack of symptoms due to peptic ulcer Dr Sandweiss has been unable to corroborate the experimental work of Weiss and Aron which seemed to show that injections of histidine protected dogs from peptic ulcer following the Mann-Williamson operation Twelve dogs were subjected to this operation in which the duodenum is diverted into the terminal ileum and the stomach is anastomosed with the jejunum Six have died five of them with ulcer and the remaining six show clinical signs of ulcer in spite of injections twice daily of 1 ccm of histidine beginning the day before, or within three days of the operation Any benefit that histidine confers is therefore, Dr Sandweiss thinks not a specific one but is largely due to the psychological effect of a new method and practically the same effects follow injections of distilled water Parenteral therapy in any form he regards as of value only as an additional measure, and one which should be used only in those patients not responding to diet and alkalis and then in association with but not in place of a correct diet Such reports as these serve further to confirm the need for caution in assessing immediate results in the treatment of peptic ulcer the importance of continuous attention even in symptom free periods, and the necessity of avoiding premature conclusions as to the value of any remedial measure for a condition in which remissions and relapses are common An ordered diet it is obvious must form the basis of treating peptic ulcer

ROYAL SOCIETY CONVERSAZIONE

The conversazione of the Royal Society at Burlington House on May 4 brought forward the usual assembly of scientific exhibits, with a few historical ones which were of special interest. Among these were the royal charters of the society with the charter-book containing the signatures of the founder patrons, and Fellows from 1662 to the present day. There were also shown original manuscripts and manuscript letters of early Fellows including Boyle, Hooke, Leeuwenhoek, Leibnitz, Malpighi and Newton. Another exhibit consisted of diplomas and other original documents of William Hyde Wollaston, a recent gift to the society from the Wollaston family. Wollaston was a physician of some fame in the provinces and London but, being beaten in competition for a post at St. George's Hospital, became a truant from medicine and devoted himself to some fruitful research in chemistry and optics. One other link with past times was an unrecorded water-colour portrait of John Dalton, this was shown under the zoogroscope, a contemporary optical instrument used for domestic entertainment in the eighteenth century. From these excursions into the science of other days the visitor was sharply recalled by other exhibits to the marvels of present invention. A number of exhibits related to investigations on plants, especially on virus infections. Imperial Chemical Industries has been experimenting on plant hormones. Substances have been isolated from plants and shown to possess growth promoting properties and some of the striking effects of heteroauxin as one of the substances is called on plant tissues were demonstrated. In another field there were cameras for television, microscopes for ultra-violet light and an instrument for the photographic recording of transient phenomena such as lightning surges with which records could be obtained of phenomena lasting only one or two millionths of a second. Professor H. Woollard exhibited x-ray films illustrating the lymphatics of the human body after injection with thorotrast and barium. The films showed the longitudinal pattern of the vessels in the extremities and the circular arrangement around the trunk, how the lymphatics above converged on the axilla and those below on the groin. It was also shown how thorotrast injected into the living body has been used for the investigation of lymphatic oedema and obstruction, the lymphatic flow in skin transplantation and tube pedicle grafting. In cancer research the injection of the lymphatics shows that normal lymphatic vessels traverse the cancer mass, that many lymphatics about the cancer remain patent and contain no cancer cells, and that normal lymphatic vessels pass from the cancer to lymph glands which have been found to contain cancer cells. Some of this work with thorotrast is described in the recent annual report of the British Empire Cancer Campaign. Another demonstration was of a subjective phenomenon by Dr. W. D. Wright. Two patches of light were matched by viewing one in the right eye and the other in the left. The right eye was then light adapted and the two patches again compared to determine the loss of sensitivity produced by the light adaptation. A further series of matches could then be made to

record the course of the recovery of the presumably photochemical reaction in the retina. This instrument has been used to measure the adaptation functions of normal eyes and it is hoped to extend the measurements to test the effect of various pathological conditions on the adaptation process. An unusually large number of exhibits of biological and zoological interest were on view among these two may be mentioned one illustrating the ornateness of Nature and the other her occasional fretfulness. The first was the tails of birds of paradise bringing out their variations and the second was an extraordinary collection of spiny mammals—echidnas of the Australian region and the more familiar hedgehogs and porcupines. Both were from the Natural History Museum. During the evening a short lecture was given by Professor Andrade on events and personalities in the history of the Royal Society and the vicissitudes of its Fellowship in days gone by.

THE CAMPAIGN AGAINST JUVENILE RHEUMATISM

In a recent communication to the Permanent Committee of the Office International d'Hygiène Publique¹ Professor D. Danielopolu with two colleagues provides an interesting survey of the problem of rheumatism and rheumatic heart disease. In any organized campaign against this affliction Danielopolu lays stress upon preventive measures although unfortunately the climate cannot be changed for all potentially rheumatic children, it is important that long periods of convalescence under optimum climatic conditions should be available for those who have had an attack. Improvement of housing conditions is also urged as important. Danielopolu summing up the evidence on the question of removing the tonsils is in favour of leaving them alone and of dealing with tonsillar sepsis by local measures. The authors consider that treatment with salicylates begun early and in big enough doses constitutes an important measure in preventing heart disease. Once the heart is affected the campaign must be organized along these lines. It is important to look for cardiac lesions among children with few or no symptoms in order that the routine of their lives may be adjusted before harm is done. Advice may also be given as regards marriage, pregnancy, surgical operations and other possible situations which the patient with rheumatic heart disease may encounter. Financial aid to cardiac patients and to their families is also mentioned and the authors outline a system of co-operation between the various bodies concerned in the treatment of rheumatism such as hospitals, clinics, convalescent homes and public institutions.

We regret to announce the deaths of two distinguished representatives of medicine in the Services. Major-General John Edge, late R.A.M.C., at the age of 69, and Major-General Sir Patrick H. H. M.S. (ret.) at the age of 77.

ENDOCRINES IN THEORY AND PRACTICE

HYPERPARATHYROIDISM

BY

DONALD HUNTER, M.D., F.R.C.P.

Until twelve years ago we had no proof of the relationship between parathyroid activity and the metabolism of phosphorus and calcium. The discovery of the parathyroid hormone led at once to studies of its effects in normal individuals. When injections of an active parathyroid extract are given over a long period of time they cause a decrease in the plasma phosphorus, an increase in the serum calcium, and at the same time a mobilization of calcium salts from the skeleton, which are then passed in the urine. This knowledge has led to the discovery of cases of a bone disease associated with hyperfunction of a parathyroid tumour—the generalized osteitis fibrosa of von Recklinghausen.

In 1891, in a Festschrift in honour of Virchow's seventy first birthday, von Recklinghausen gave the first accurate account of the bone disease which now goes by his name. Although his contribution is involved and he described more than one bone disease, there can be no doubt that his Cases 5 and 7 constitute the discovery of generalized osteitis fibrosa. Thirteen years later Askanazy reported a case associated with a parathyroid tumour but no special significance seems to have been attached to the association, despite the fact that Erdheim had already noted enlargement of the parathyroid glands in osteomalacia and had suggested that they were functionally related to calcification. When opinion differed on whether the increase in parathyroid secretion was primary or secondary to the bone disease, Erdheim himself defended the view that the skeletal change was primary and that the parathyroids enlarged merely to meet the greater demand for calcium. Acting on this assumption, Mandl in 1925 transplanted four parathyroid bodies into the abdominal wall of a man with generalized osteitis fibrosa. No improvement followed, however, and he accordingly explored the neck where he found a parathyroid tumour measuring 2.5 by 1.5 by 1.2 cm. This was removed, and the subsequent disappearance of pain in the bones, the reduction of excretion of calcium in the urine, and the general improvement in the patient's health constituted the first clinical evidence that in this disease the parathyroid lesion is primary and the skeletal changes secondary. By this time it was well established that the parathyroid glands are specifically concerned in regulating the metabolism of calcium.

The isolation of an active parathyroid extract which raises the calcium of blood and urine and the recognition that injection of this extract causes loss of calcium from the bones were the next important steps in deciding that in generalized osteitis fibrosa the high calcium content of the serum, the increased calcium excretion in the urine, and the diminished density of x-ray shadows of the bones, point with certainty to a parathyroid lesion.

Morbid Anatomy

Hyperparathyroidism leads to changes which are generalized throughout the skeleton: the bones are soft and cut with a knife like rotten wood. Both cortex and spongiosa are too thin and are largely replaced by tough, grey, fibrous tissue. Multiple grey, spongy osseous swellings

occur, and sometimes expand the cortex. Firm, round, red tumours and single or multilocular cysts may be present. The great resorption of bone may lead to deformity in any part of the skeleton, and also to spontaneous fractures. Histologically the main changes are lacunar resorption, apposition, fibrosis of marrow, and the formation of osteoclastomata (giant celled tumours) and cysts. Lacunar resorption is the predominant change. There is a general osteoporosis which varies in degree in different cases. Apposition, however, does not cease, and where present it is usually abnormally active.

The condition found in the parathyroid glands may be a hyperfunctioning adenoma of a single gland or rarely of part of two glands. The greatest diameter of such tumours may be from 0.7 cm to 7.5 cm. In some cases there is a generalized hyperplasia of all the parathyroid glands, and it is possible that this is a result of an increased secretion of the parathyrotropic hormone of the pituitary gland. Bilateral renal calculi, composed principally of calcium phosphate, are commonly present. In advanced cases areas of metastatic calcification have been found in the lungs, stomach, kidneys, and myocardium.

It is possible by injecting parathyroid extract into puppies in increasing amounts over a long period to produce hyperparathyroidism experimentally. Such injections lead to progressive resorption of bone, fibrous replacement of the marrow, and to the production of other features characteristic of osteitis fibrosa. Prolonged overdosage may give rise to metastatic calcification in the tissues.

Clinical Features

Besides pain and tenderness of the bones, and even spontaneous fractures, hyperparathyroidism gives rise to symptoms and signs outside the skeleton. These include hypotonia and muscular weakness, anorexia, sometimes with nausea vomiting, and abdominal cramps, polydipsia and polyuria, renal calculi sometimes with colic and haematuria, and wasting in advanced cases. There is no one symptom which is diagnostic. Because of the insidious onset and the extremely varied symptomatology the disease is often not suspected. Anorexia, nausea, vomiting, lassitude and hypotonia may all arise early and are sometimes presenting symptoms. Polyuria and polydipsia are the rule and may be so marked as to suggest diabetes insipidus. Increased frequency of micturition during the night may be a distressing feature, and occasionally there is enuresis. The large quantity of water necessary for the increased excretion of calcium salts is of course responsible for this group of symptoms.

Hyperparathyroidism is a progressive disease, and if untreated it is usually fatal. It is more than twice as common in women as in men and it occurs at all ages, but most commonly in middle life. The youngest case known is in a boy of 10 and the oldest in a woman of 69. It is possible to describe several different types of hyperparathyroidism for the clinical features vary according to whether the skeletal, renal, or gastrointestinal symptoms predominate.

CLASSICAL TYPE WITH FIBROCYSTIC SKELETON

In this type the skeletal symptoms and signs predominate. They consist of pain, bone deformities, generalized decalcification and sometimes fractures. Though this type may begin with weakness, thirst, and polyuria most

MINISTRY OF HEALTH REPORT ON MATERNAL MORTALITY ADDENDUM TO ANNUAL REPORT OF COUNCIL

The Ministry of Health's report, issued as a White Paper, of a special investigation carried out by certain members of the medical staff of the Ministry into maternal mortality in selected areas in England and of a similar investigation throughout the whole of Wales by medical officers of the Welsh Board of Health is summarized in the *Journal* at page 972 and a leading article appears on page 977.

The recommendations are given below, the most important of which are those designed to improve the standard of obstetrics.

(1) The establishment under the direction of the medical officer of health of an adequate service of obstetric consultants.

(a) to assist medical practitioners who undertake domiciliary midwifery in cases of doubt or difficulty in the antenatal period at the time of confinement and during the puerperium.

(b) to conduct consultative ante-natal and post-natal clinics to which patients may be referred by general practitioners or from the routine ante-natal and post-natal clinics.

(c) to exercise clinical supervision over the in-patient treatment of the maternity patients for whom the local authority assumes responsibility.

(d) to supervise the treatment of patients suffering from puerperal sepsis.

(e) to be responsible for the emergency domiciliary service for cases of grave obstetric abnormality in which removal to hospital is contraindicated (for example certain cases of shock, ectopic or haemorrhage).

(f) to assist the medical officer of health in the confidential investigation of the circumstances associated with each maternal death occurring in the area.

(2) The local sanitary authorities in consultation with the local medical profession should in future be empowered to take steps to ensure that the best local obstetric services are available in all cases in which midwives are required under the rules of the Central Midwives Board to call in a doctor.

(3) For a limited time, a fund should be provided which members of the staff of maternity hospitals will be available to the domiciliary treatment of patients

patients whose condition is too grave to justify their removal to hospital.

(4) Properly constructed adequately equipped and suitably staffed maternity accommodation (including a sufficient number of beds allocated to and reserved for ante-natal patients) should be provided to meet the needs of every area. Wherever practicable the accommodation should be provided in association with general hospitals.

(5) Arrangements should be made for

(a) adequate domiciliary visiting by health visitors of expectant mothers with a view to encouraging them to engage an attendant for the confinement and place themselves under ante-natal supervision at an early stage of pregnancy.

(b) the provision of ante-natal clinics in every district in which the number of expectant mothers justifies it. In sparsely populated areas other arrangements should be made for efficient medical domiciliary ante-natal supervision and

(c) the establishment of consultative ante-natal clinics to serve every area.

(6) Satisfactory arrangements for the accommodation and treatment of patients suffering from puerperal sepsis and from abortion are essential.

(7) The development of post-natal services including the establishment of clinics and arrangements for in-patient treatment is a matter of urgent necessity.

(8) The education of the woman herself and of the general public should constantly be borne in mind by all concerned with maternal welfare as the whole-hearted co-operation of mothers is essential to the success of any measure designed to reduce maternal mortality.

(9) A service of home help should wherever practicable be provided.

(10) Adequate records should be kept in connexion with every branch of a maternity service. Free interchange of such records between all professionally concerned is essential in order to secure continuity of supervision and treatment.

(11) Arrangements should be made in every district to ensure that no expectant or nursing mother requiring extra nourishment on health grounds fails to receive it for a short period as may be necessary.

MEMORANDUM BY THE B.M.A. COUNCIL

The following is a memorandum by the Council of the British Medical Association.

1. The Council is entirely in sympathy with any efforts which can be made towards a reduction of maternal mortality. It realizes that important objectives in a

number of individual cases is an important element in the situation and wishes to contribute to the utmost of its power to the elimination of this and of other factors. In this spirit it makes the following observations and suggestions.

2 The Council of the Association is disappointed to find that in so far as the investigation was directed to the relevant conditions prevailing in some areas with a persistently high maternal mortality rate as compared with those in other areas, it appears to have achieved no definite results. It is not reported that the standard of midwifery practice is lower in the black areas than in the control areas. Moreover, such recommendations as are made appear to be intended for general, not merely for local application. The ground of the inquiry being thus shifted the conditions disclosed by the report and the recommendations made must be considered in the closest relation to the conclusions and recommendations of the recent Departmental Committee concerned with a similar but more general inquiry. The Departmental Committee was composed of obstetricians, medical officers of health, general practitioners, experts in medical research and medical officers of the Ministry of Health. It sat for four years and conducted a most thorough investigation into the circumstances surrounding 5,804 deaths.

3 One of the most important passages in the Final Report of the Departmental Committee reads as follows:

We have found that the causes of death in these cases are of varied nature—clinical and social administrative and economic—and are closely related to each other. Thus clinical errors are contributed to by economic conditions and administrative measures are rendered nugatory by reason of ingrained social customs. A complete knowledge of all the circumstances in any case of maternal death is therefore necessary before apportioning blame to any individual or institution. We are convinced however that the primary essential for the reduction of a high maternal mortality is sound midwifery before, during and after childbirth.

With the views expressed in this paragraph we agree. That there are important factors other than clinical should never be forgotten and it is evident that the remedy is by no means simple.

4 The Departmental Committee put forward a number of recommendations both clinical and administrative in character. Their advice on clinical matters is finding its expression in medical practice while of the recommendations of an administrative character some have found adoption and others have been completely or almost completely disregarded, especially that concerned with the discontinuity of responsibility and attention, which is probably the greatest weakness in existing organization. Until this defect is removed it is unlikely that any permanent solution of the problem will be attained.

5, The Departmental Committee made certain recommendations for improvement in the teaching of obstetrics to medical students. These recommendations with one exception were immediately accepted by the General Medical Council and within the last six months students who have enjoyed this amplified education have begun to enter the ranks of the medical profession. The General Medical Council was unable to implement the suggestion that students should be required personally to conduct as many as thirty confinements (it prescribed twenty) owing to the insufficiency of cases available for medical education. This scarcity was the result of a wasteful distribution of midwifery material a state of affairs which has improved somewhat in the last few years and which may be further improved with the help of the Ministry by re-allocation of the available midwifery material.

6 Any adequate co-ordination of the work of general practitioners and of the other members of the obstetric team so strongly urged by the Departmental Committee is still absent in all but a few areas. An instructive

example of what can be achieved by willing and intelligent co-operation is found in the experience of Rochdale an account of which was published in the *British Medical Journal* of February 16, 1935 (p. 304). Here as a result of the organization of the different units into a team *without change of personnel* by co-operation and consultation, the maternal mortality rate, which was one of the highest in the country, has become one of the lowest. Certain well-known and often fatal errors of judgement, formerly frequent in the town, almost disappeared. The general practitioners of the town are now encouraged to send difficult cases to hospital, and are given permission to continue to treat them. Over thirty avail themselves of the opportunity, and the system involves no difficulty in administration.

7 The Departmental Committee found errors of judgement on the part of general practitioners to be a primary avoidable factor in 11 per cent of the deaths they investigated—that is less than one death in every 2,000 cases attended. The Committee stressed the fact that these errors were largely contributed to by the extremely difficult conditions under which the practitioners have to carry on this branch of their professional work. These difficulties can be greatly ameliorated by administrative and legislative action.

8 Such evidence as we have access to in cases regarded as examples of inexpert midwifery on the part of general medical practitioners appears insufficient to support all the conclusions arrived at in the section of the report dealing with this matter either by reason of its *ex parte* character or incompleteness, or because of the possibility of a permissible alternative judgement as to the propriety of the measures actually adopted in the circumstances of particular cases.

9 To those recommendations of the present report which are designed to improve the standard of obstetrics the Council raises no objection as worded. It seems evident to the Council, however, that it would be preferable that they should be implemented by a national maternity service which embodied and enforced them rather than by urging them piecemeal, or even in their entirety, upon local councils which may or may not adopt them according to different methods and with or without modification. The Council is strongly of opinion that arrangements should be made in all areas, and not only in sparsely populated areas, for efficient medical domiciliary ante-natal supervision.

10 The method of carrying out the following recommendation is of special importance:

'The local supervising authority, in consultation with the local medical profession, should in future be empowered to take steps to ensure that the best local obstetrical skill is made available in all cases in which midwives are required under the Rules of the Central Midwives Board to call in a doctor.'

Under certain conditions the Council is prepared to consider the establishment in areas of lists of practitioners who will be available for midwives emergencies and desires to ensure so far as possible that those practitioners whose names are on such lists shall make the best local skill available for the service.

11 A proposal—by itself—that there should be an amendment of one of the rules of the Central Midwives Board whereby midwives would in case of "emergency" be able to call for the services of certain selected practitioners only and that local authorities should be advised and encouraged to make such selective lists, is not one which can be approved or supported by the British Medical Association. This suggestion is an example of a policy against which the Association has protested from time to time. Suggestions to remedy the imperfections in the conduct of maternity have been adopted piecemeal by legislative or administrative action. They have not all had the effect that they were expected to produce. They

have not been brought into proper relationship with each other they have been variously brought into operation in different local government areas and in some of these areas they have been almost ignored or of little practical use. For a considerable period now the Association has urged the establishment by legislation of a national maternity service which would at the same time make available for every mother all those services which are necessary for safe maternity, and avoid local variations in essential requirements from whatever cause arising. The Association is strongly of opinion that legislation on these lines is urgently necessary, and the recent introduction into Parliament of the Maternity Services (Scotland) Bill seems to indicate that this is accepted.

12 As the Association has previously pointed out this conclusion has been arrived at not merely by reason of the relative failure of the past policy of piecemeal and essentially unco-ordinated action but by consideration of the results of domiciliary midwifery in working-class and populous areas where more careful and co-operative methods have obtained and by the proved need for establishing the principle of continuity in the responsibility for maternity, which the Association believes to be fundamental. The Association has unambiguously stated the twofold sense in which continuity is required. The period of maternity from beginning to end cannot properly or advantageously be segregated from the whole health history of the mother. It has intimate relationships with illnesses previously suffered with other morbid conditions appearing during its course and with disorders thereafter arising. Further the three periods of maternity itself—pre-natal, natal and post-natal—can best be supervised under the responsibility of one practitioner whatever expert or specialist assistance he may require in certain contingencies.

13 The proposal mentioned in paragraph 11 is not only inconsistent with these principles and considerations but would necessarily in many cases directly aggravate the disadvantages of the existing state of things. To state only three inconsistencies which might immediately arise

(i) Many insurance practitioners would be by statute charged with the duty of attending or accepting responsibility for insured women from the time conception took place up to the moment that labour pains began and again from ten or fourteen days after delivery while they would be prohibited if the mother wished to take advantage of State provision from having anything to do with her in the intervening period.

(ii) There would be practitioners in some areas freely available for attendance in the case of midwife emergencies while in a neighbouring area they might be debarred from any such attendance owing to alleged incompetence or inexperience.

(iii) In one area in 3 per cent of all confinements the emergency was such as to require the immediate attendance of a practitioner in order to save the life of mother or child so that in many rural areas the midwife might by rule be prohibited from calling in the most easily available practitioner.

The Association regards these inconsistencies as seriously undermining any such proposal with the result that it is unlikely to be tolerated either by the profession or by the public.

14 There are other objections to the proposal of a different but equally serious character. The rights of registered medical practitioners are governed by the Medical Acts. The conditions of medical education and registration are prescribed by the General Medical Council in the interest of the public. It is of course never claimed that a practitioner immediately upon qualification is fully competent to deal himself with any and every condition that may confront him in every branch of practice. He should however be competent to deal with many things at once and do so safely and be able to profit therefrom by daily accumulating experience. There are

many minor abnormalities of obstetrics included in the "emergencies" of a midwife with which every newly qualified or young practitioner is able to deal safely and successfully. He should not be prohibited from dealing with them if a patient desired that he should do so nor is it just nor in the public interest that from the beginning he should be debarred from at least 60 per cent of the field of midwifery experience open to him.

15 It is not denied that there are in the aggregate a considerable number of practitioners who voluntarily refuse to undertake obstetric practice, or whose practice in this branch of medicine is very limited in extent (though this as in other medical conditions does not mean that they are incompetent to deal with such cases). There are undoubtedly a number of others (even some who have had fairly extensive experience or have taken post-graduate courses) who do not always conduct maternity cases with perfect wisdom, or who fail to avail themselves of specialist or institutional help in such cases as need it as promptly as they should. These things cannot be completely eliminated even with selected lists. It is agreed that they ought to be minimized as far as possible. The Association holds that this can best be brought about in the general interest by encouraging the undertaking of obstetric work by general practitioners, not by their disassociation from such work and that this can be helped

(a) by increasing the interest of this work by bringing the practitioner into early contact with the prospective mother during the ante-natal period and investing him with a definite responsibility throughout and (b) by removing as far as may be some of the disadvantageous and uncomfortable conditions under which this work is often done at present as by the provision of adequate nursing of a second practitioner for administering an anaesthetic of a home help in suitable cases of an accessible and easily available consultant service and of the means of removal to hospital where necessary.

The Association's view is that there should be a national maternity service established on these lines rather than varying and variable local arrangements built up more or less haphazardly at the option of local authorities.

16 The Association willingly offers any and every help that it can give to the Government in the immediate future towards the consideration, discussion, and formulation of legislation for this purpose in general accordance with the proposals of the Association set out in its publications on this matter and broadly with the Maternity Services (Scotland) Bill now before Parliament.

17 With regard to early action the plan which the Council of the Association greatly prefers and would urge upon the Minister is that each local authority should prepare a list of local medical practitioners who are willing to make themselves available to be called in by midwives that such practitioners collectively should at once be brought into close touch with the consultant obstetricians recognized for the service in the area and should be kept in frequent association with those consultants with a view to the appreciation of their several spheres of action to instruction as to the proper course of action and the means of securing appropriate help in cases of difficulty and to the mutual and confidential investigations as to the causes of difficulty or of death. If thought necessary it might be arranged that if a practitioner's name was to continue on the list beyond a certain period of years he should have to undertake a more formal post-graduate course in obstetrics and it might be possible to establish some machinery by which the name of a practitioner whose work proved unsatisfactory might be removed from the list. In some such way as this the Council believes that local lists would be established in a less objectionable and less difficult way than in any other and that the lists so established under these conditions would prove to be more satisfactory and successful in maintaining an adequate service. The Council suggests that such lists should be established at the time or shortly after the time at which the Midwives Act comes into operation.

INSURANCE CAPITATION FEE—COURT OF INQUIRY

After consultation with the British Medical Association the Minister of Health and the Secretary of State for Scotland have appointed the following to be a Court of Inquiry into the amount of the capitation fee to be paid to insurance practitioners: Lord Amulree (Chairman), Mr Thomas Howorth, and Mr D H Robertson.

The agreed terms of reference to the Court of Inquiry are to inquire and report to His Majesty's Government whether any and if so what alteration ought to be made as from January 1 1938, in the amount of the capitation fee (per insured person per annum) on the basis of which the Central Practitioners Fund under Article 19 of the National Health Insurance (Medical Benefit) Regulations, 1936 and the corresponding Scottish Fund under Article 19 of the National Health Insurance (Medical Benefit) Consolidated Regulations (Scotland) 1929 is calculated, having regard to any changes which may have taken place since 1924 in the cost of living, the working expenses of practice, the number and nature of the services rendered by insurance practitioners to their insured patients, and other relevant factors. The inquiry is to proceed on the assumption that as from January 1 1938, employed persons under the age of 16 will have become entitled to medical benefit by virtue of amending legislation, but that the conditions would not impose any obligation upon the practitioner to issue medical certificates to these persons. This capitation fee is not to include any payment in respect of the supply of drugs and appliances or any payment to meet the special conditions of practice in rural and semi-rural areas. Payments to insurance practitioners in respect of these matters are the subject of separate arrangements and are outside the scope of the inquiry.

Mr E H Phillips, Ministry of Health, Whitehall, S W 1, has been appointed Secretary of the Court.

NOTES OF THE WEEK

L.C.C. Fracture Clinic

The report on the hospital services of the London County Council includes an account of the work of the fracture clinic established by the Council at the Fulham Hospital in June, 1935. It has been found that the use of modern ambulatory methods has resulted in a considerable saving in the number of beds previously occupied by fracture cases, and the continuous supervision which can be exercised by the staff of the clinic during the later stages of treatment has proved beneficial in the production of good functional results. The clinic is held in an annexe of the massage department, and the senior personnel of this department are always present in order to ensure close co-operation. An interesting scheme for following up fracture cases has been arranged. Each patient who has attended the clinic will be asked to return for observation purposes twice a year for five years after his discharge, and it is hoped that the staff of the clinic will thus be able to collect much useful and interesting data on the final functional results of fractures treated by different methods.

Free Choice in Gosforth

Subject to the approval of the Ministry of Health the free choice method of providing domiciliary medical service for public assistance patients is to be introduced in Gosforth for an experimental period of one year.

Report on Alcohol and Road Accidents

When Mr Isaac Foot was addressing the British Women's Total Abstinence Union on the dangers of alcohol to motorists he deplored the Government's delay in taking action on the British Medical Association's report on the

relation of alcohol to road accidents. It will be remembered that the committee which considered this question was appointed on the invitation of the Minister of Transport.

State Medical Service in Tasmania

The Premier of Tasmania has outlined a plan for a State medical service, the first appointments under which are to be made next year. Ten practitioners will then be appointed as State doctors for prescribed areas, and State clinics will also be established. It is said that at present private doctors cannot afford to travel twenty or thirty miles to see a patient unless they are assured of payment. The State doctors will not be subject to such economic conditions and patients will not be deprived of treatment owing to their incapacity to pay a private doctor's fee. The State doctors appointed to country districts will be enabled to attend refresher courses periodically in the towns.

OPEN CHOICE SCHEME IN WILTSHIRE

The open choice scheme in Wiltshire, which was introduced in July, 1933, owes its origin to a conversation between Dr G Laurence, now chairman of the Medical Advisory Committee of the Wiltshire Branch of the British Medical Association, and the county medical officer, Dr C E Tangye. Dr Laurence was impressed with the inequalities and absurdities of the old salaried arrangements, and suggested the desirability of working out some such arrangements as have since been provided. To the close co-operation between Dr Laurence and Dr Tangye is largely due the initiation and subsequent successful working of this scheme. The following account of the scheme in operation has been received from the county public health department.

At the time the open choice scheme was started in Wiltshire there was practically no experience in any other area upon which to rely in preparing the arrangements and the records available of work performed in the county by salaried officers were unreliable.

Under the boards of guardians the seventy-three medical relief districts of the county were served by sixty salaried officers in forty-seven districts, the rest of the county being served under the open choice scheme by forty-four doctors in twenty-six districts including Swindon. As salaried posts terminate owing to superannuation or otherwise, the scheme is extended to the districts concerned, and in this way, if continued, the scheme will eventually operate throughout the county. In the remoter areas where there is only one available doctor in practice there can be no choice, but the principle of the scheme is to provide a choice where it is possible.

Finance

For the first six months the scheme was based upon payment for individual items of service rendered but it was found that even on a very low rate of payment the expenditure became so large as compared with the previous total of salaries that a capitation fee was introduced as from January 1 1934. The total population eligible for relief is constantly varying, and it is impossible to arrange a capitation basis otherwise than in respect of persons actually treated. It has been estimated that under the national health insurance scheme the cost per person treated including drugs is 18s. 9d. and it was thought fair that the capitation fee under this open choice scheme should be 25s., mainly because it was anticipated that the patients concerned would be of the chronic type requiring more frequent visits than the ordinary insured person. Consequently the figure of 25s. was fixed as a not unreasonable payment, particularly in country districts where the doctor must spend a certain amount of time in getting to the patient. This fee was, however, fixed at £1 in the Swindon area where a lesser payment was warranted in view of the comparatively close aggregation of patients. There has since been no

variation in the rate of remuneration. The capitation fee naturally represents very small remuneration where the patient receives medical attention throughout the whole of the year—as frequently happens with old or chronic cases—and for a case seen only a few times or where there are several patients in one family the remuneration may appear excessive, but the average is considered fair.

During the year 1936 1,724 patients were treated under the open choice scheme, 922 in the country area and 802 in the Swindon area. The total cost was £2,261 15s 3d., or £470 17s 2d more than the sum previously paid in salaries in the area covered by the scheme. In the area apart from Swindon the actual cost was £102 13s 1d less than under the old salaried appointments, but in the Swindon area it was more by £573 10s 3d. It is obvious that the salary of £250 per annum previously paid to the one medical officer by the Swindon Board of Guardians could not under any arrangement have provided adequate medical attention for an average of 915 sick persons.

Visits, Incidental Expenses, etc.

The average number of visits or consultations per patient during 1936 was 7.8 in the Swindon area and 10.7 in the country districts or 9.3 in the whole area covered by the scheme. The average cost per item of service—that is, consultation whether by visiting or at the surgery—was 2s. 9d.

Provision is made for payment of incidental expenses (special medicines special fees—for example in respect of fractures etc.) but in practice these expenses have been quite inconsiderable mainly owing to the fact that special treatment of such varied kinds is available under other branches of the county health service. Medical extras in the technical sense of the term—for example milk cod liver oil eggs butter etc.—have not been increased as was at one time anticipated as a result of the work being carried on by doctors previously unassociated with Poor Law.

Travelling is remunerated on the basis of 6d per mile each way over two miles from the doctor's surgery to the patient's home. This represents rather better travelling allowance than that provided under the national health insurance scheme.

Clerical Work

The scheme naturally involves a considerable amount of clerical and statistical work at the end of each quarter when the cards come in and are used as the basis of the doctors' payments. In practice this has involved at quarterly intervals some four or five days' work by a senior clerk or with the statistical matter at the end of the year, some three or four weeks' work annually. Clerical work is not necessary to any serious extent during the quarter. It is fortunate that the clerical work has been from the beginning in the hands of one senior clerk, who has been specially interested in the scheme to the extent of doing a great deal as overtime, but even in other circumstances the system adopted in Wiltshire should not involve an undue amount of clerical labour though the work is naturally of a responsible nature which cannot be entrusted to a junior clerk.

Pensionable Medical Officers

The effect of the Local Government and Other Officers Superannuation Act 1922, is to lay a much heavier pensions burden upon the authority in respect of salaried district medical officers, who now draw their pensions at 65 instead of at the variable ages associated with older Acts. Under the Wiltshire open choice scheme pensionable officers are no longer appointed and difficulties and expenditure in connexion with pensions are thus avoided medical officers continuing to serve as long as they are in practice. Where only one doctor is available a most awkward situation would arise under the old scheme of salaried posts should he claim his pension at 65.

General

The scheme is now fairly stabilized and the three years' experience has brought out interesting features. The system of record keeping, though perhaps requiring more attention

from doctors than the old returns furnishes the health department with complete records which are of the greatest value in bringing this work into co-ordination with all the other services. These records are necessarily regularly forthcoming as they form the basis of payment to the doctor and in this respect they contrast favourably with the returns under the old salaried service which were confessedly very incomplete and often wanting altogether. This system has also the great advantage of bringing the practitioner's district work into close touch with the county health department.

From the patient's point of view it has proved a great benefit to be able to choose a doctor and particularly to be able to continue under the care of the same doctor after retiring from work and being no longer under national health insurance. It was originally anticipated that difficulties might arise from the wish of the patient to change his doctor or the wish of the doctor to hand over unwelcome patients to another practitioner and these eventualities are provided for in the scheme. In practice however, a change is of rare occurrence and the actual procedure causes no difficulty.

From the doctor's point of view this scheme secures uniform payment on a basis approved by the British Medical Association. The Medical Advisory Committee representing the medical profession of the county has given every possible help in the development of the scheme since its inception in 1933 and through that committee the good will of the profession has been obtained. The British Medical Association has helped by advice in details and particularly by its approval and support of the terms of remuneration.

THE INSURANCE MEDICAL SERVICE WEEK BY WEEK

Excessive Prescribing

The number of cases in which disciplinary action has been taken by reason of excessive prescribing, as already noted in this column, has dwindled almost to zero in recent years. A case which has been under consideration by the London Panel Committee has, therefore, unusual interest. The facts forming the basis of the investigation are substantially as follows. During the fourth quarter of 1935 the practitioner issued 5,037 prescriptions at a total cost of £164. The mean number of insured persons on the practitioner's list for the quarter was 2,130. The average cost per person of the prescriptions issued was 18.48 pence, whereas the corresponding average for the whole area for the same period was 10.03 pence. If the practitioner's average cost per person had been the same as that for the area, his prescriptions would have cost only £89. The excess cost on that basis was therefore £75.

The case has been the subject of an appeal, and a lengthy report appears in the minutes of the Insurance Committee. In the course of a letter to the Ministry of Health the practitioner makes a series of statements in support of his appeal, from which the following are extracts.

"Very often a long prescription is due to the fact that when a patient is given a mixture he states that it did him no good, and an additional ingredient is added and so on until he is satisfied that he has the most beneficial mixture. Then one day he comes and states that he has a cold in addition to his bronchitis, and of course the necessary ingredients are embodied in the prescription. Also it is necessary to put in ingredients which counteract the possible harmful effects of other ingredients.

"Usually I give only one mixture for a cold to a person who has not reported sick previously but in the case of the person who has attended for previous colds I am sometimes told when I refuse them for something for the night cough for instance, that they are paying for it and then there is the patient who states he is suffering from some complaint other than the one he has just told one all about he would like something for that also but he says he knows you are not allowed to give too much."

This appears judging from the report of the persons appointed to hear the appeal, as rather unconvincing by way of explanation of an 85 per cent excess in the case of this practitioner over the average of his brother practitioners. They state

The members of the tribunal find themselves in some difficulty about this case. They do not wish to limit in any way the right of a practitioner to give any treatment *he thinks* necessary and proper in any case and the patient has every right to such treatment. But the thinking referred to should be reasoned thinking based on a knowledge of the principles and practice of modern medicine and should not be directed solely or mainly by the opinions of the patient. After anxious consideration of the statements laid before them by the practitioner they cannot convince themselves that the decision of the London Panel Committee was unreasonable or unjust and therefore they have no option but to dismiss the appeal. They do not wish to impugn the bona fides of the practitioner though they find themselves very much at variance with his methods of prescribing.

One aspect of the case is particularly worthy of notice. The excess cost of prescriptions was £75. The Panel Committee found that, after making every allowance in the practitioner's favour, the excess might be estimated at £38, and the Insurance Committee, to whom the matter was referred after the appeal had been heard in order to make a recommendation as to the penalty, has decided that the withholding of the sum of £25 would be sufficient by way of a deterrent on this occasion, having in mind that it would be open to the Committee in the event of any repetition on the part of the practitioner to recommend the withholding of a more substantial amount.

Scottish Drug Testing

The reports on the drug testing activities of Scottish Insurance Committees during the year 1936 have been generally collated and the cumulative results indicate that the quality of drugs served and the efficiency of dispensing services under the National Health Insurance Act are of an eminently satisfactory order. The tests have revealed that neither in quantity nor quality have there been any lapses from the vigilance demanded of chemists, and the few minor examples of doubtful dispensing that were submitted to Pharmaceutical Service Subcommittees throughout the year for consideration and report were not of serious import.

Lectures on Air Raid Precautions

An insurance practitioner in Edinburgh had recently been attending lectures and demonstrations organized by the Home Office on air raid precautions. The suggestion had been made at these lectures that doctors should be given civilian gas masks to show and explain to their patients during consulting hours. In the opinion of the Edinburgh practitioner, however, a more satisfactory method would be for the doctors to give lectures and demonstrations to their patients under arrangements made by the Insurance Committee on the lines of existing health lectures. This doctor has been informed that the Committee would bear his suggestion in mind in making future arrangements for health lectures.

The Medical Service in Glasgow

From the annual report of the Insurance Committee for the Burgh of Glasgow we make the following extracts, which may be of interest to insurance practitioners generally.

The number of insured persons in the area of administration of the Committee represented in the Committee's Index Register as at January 1, 1937 was 443,263—289,269 males and 153,994 females.

The number of practitioners on the medical list of the Committee on January 1, 1937 was 497 (439 males and 58 females) being a decrease during the year of 15 (10 males and 5 females). During the year 28 practitioners retired from the medical list and 6 died. The number of additions to the list

was 19. Of the 497 practitioners on the list of the Committee 414 are resident within and 83 outwith the city. These 497 practitioners have 677 consulting rooms—580 in and 97 out with this area. Eleven practitioners have notified the Committee that they practise homoeopathy.

The number of medical partnerships in the area is 67 affecting 138 practitioners. Sixty-four are partnerships of two practitioners, two of three practitioners and there is one partnership of four practitioners.

There are 16 practitioners required to employ assistants owing to the number of insured persons on their lists exceeding 2,000, the number allowed under the provisions of the allocation scheme to be on the list of a single-handed practitioner. There are also 33 other practitioners who although not required by the allocation scheme employ assistants. The following statement shows the grouping of insured persons on the lists of practitioners.

6 practitioners have no insured persons on their lists
169 have lists of from 1 to 400
155 have lists of from 401 to 1,200
131 have lists of from 1,201 to 2,000
36 have lists of over 2,000

497

Naval, Military, and Air Force Appointments

ROYAL NAVAL MEDICAL SERVICE

Surgeon Commanders A. de B. Joyce and W. G. C. FitzPatrick to the *President* for Medical Department.
Surgeon Lieutenant G. C. Denny to the *Excellent*.

ROYAL ARMY MEDICAL CORPS

The following Lieutenants to be Captains with seniorities from the dates indicated in parentheses: J. A. MacDougall (April 24, 1936), J. C. A. Marchand (April 24, 1936), D. Wright (April 25, 1936).

The appointments of the following Lieutenants have been ante-dated to the dates indicated in parentheses under the provisions of Article 36 Royal Warrant for Pay and Promotion, 1931 but not to carry pay and allowances prior to April 24, 1936: J. A. MacDougall (April 24, 1935), J. C. A. Marchand (April 24, 1935).

Lieutenant (on probation) A. F. H. Keatinge has been confirmed in his rank.

ROYAL AIR FORCE MEDICAL SERVICE

Flight Lieutenants S. B. S. Smith to Central Medical Establishment London, R. C. H. Tripp to No. 1 School of Technical Training (Apprentices) Halton, C. A. Rumball to R.A.F. Institute of Pathology and Tropical Medicine Halton, J. S. Wilson to No. 8 (Bomber) Squadron Aden.

Flight Lieutenant H. J. Melville has been transferred to the Reserve Class D.

Flying Officer H. C. de B. Milne to be Flight Lieutenant.
Flying Officer C. E. G. Wickham to R.A.F. Station Marham.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Captain W. H. G. Park to be Major.
Captains F. Lawrence and R. G. Karm M.C. have resigned their commissions.

Lieutenant A. Bennett from 7th Battalion Cheshire Regiment to be Captain, with seniority May 1, 1934.

R. J. McGill (New Zealand Forces Reserve of Officers), W. S. Evans, H. B. Collins, H. R. J. Donald (late Cadet Corps of Winchester College Contingent, Junior Division O.T.C.), E. Fulford (late Officer Cadet, University of London Contingent, Medical Unit Senior Division O.T.C.), K. G. Sugden and G. T. Bevir (late Cadet Sergeant, St. Edward's School Oxford Contingent, Junior Division, O.T.C.) to be Lieutenants.

TERRITORIAL ARMY RESERVE OF OFFICERS ROYAL ARMY MEDICAL CORPS

Captain C. A. D. Mitchell from active list to be Captain.

AUXILIARY AIR FORCE RESERVE OF OFFICERS MEDICAL BRANCH
Flying Officer T. E. Cawthorne has relinquished his commission on completion of service.

INDIAN MEDICAL SERVICE

The services of Captain R. De Soldenhoff have been placed temporarily at the disposal of the Government of Bombay from January 28.

Lieutenant (on probation) J. G. Thomson to be Captain (on probation) with seniority May 1, 1936.

To be Lieutenants (temporary commissions): S. A. Mian V.P. Gupta, I. Mallik, M. S. Rao, P. Dass, S. A. Hasan and S. M. Basu.

Group of Psychological Medicine of the Association

Notice is hereby given of the formation by the Council of a Group of Psychological Medicine, which shall be composed of all those members of the Association who are engaged predominantly in the practice of psychological medicine. Every member of the Association coming within this definition is *ipso facto* a member of the Group. Members of the Association who claim to conform to this definition are requested to notify the Medical Secretary B.M.A. House, Tavistock Square, W.C.1, not later than May 22, 1937. The first general meeting of the Group will be held at a date to be subsequently announced in the *Supplement*.

April 28

G. C. ANDERSON

Medical Secretary

Belfast Meeting Annual Dinner, July 22

Reservations of tables for the Annual Dinner which is being held in the Kings Hall Balmoral, and is this year taking the form of a dinner-dance, are being made daily, and early application is advisable. The numbers of the tables already booked are 1-9 14 16, 21 22, 26, 28 30 31 38 39, 40 41, 42, 43, 44 47, 48 49, 50 51, 52, 53 56 57 59, 60 61, 66 68 69, 72 74, 75, 78 81 83, 86, 87 89 90 92 93 95 98. All applications must be accompanied by the correct subscriptions and an alternative choice of tables should be given (see *Supplement*, April 10 p 179).

Katherine Bishop Harman Prize

The Council of the British Medical Association is prepared to consider an award of the Katherine Bishop Harman Prize of the value of £75 in the year 1938. The purpose of the prize founded in 1926, is the encouragement of study and research directed to the diminution and avoidance of the risks to health and life that are apt to arise in pregnancy and child bearing. It will be awarded for the best essay submitted in open competition competitors being left free to select the work they wish to present, provided this falls within the scope of the prize. Any

medical practitioner registered in the British Empire is eligible to compete.

Should the Council of the Association decide that no essay submitted is of sufficient merit, the prize will not be awarded in 1938 but will be offered again in the year next following this decision, and in this event the money value of the prize on the occasion in question shall be such proportion of the accumulated income as the Council shall determine. The decision of the Council will be final.

Each essay must be typewritten or printed in the English language it must be distinguished by a motto and accompanied by a sealed envelope marked with the same motto and enclosing the candidate's name and address. Essays must be forwarded so as to reach the Medical Secretary (to whom inquiries may be sent) B.M.A. House Tavistock Square London, W.C.1, not later than December 31, 1937.

Election of 22 Members of Council by Grouped Branches in the British Isles

The following is a list of the nominations received for 1937-8

Group	Branches in Group	Candidates Nominated	No of Seats
A	North of England	Dr. J. Hudson (Newcastle-on Tyne)	1
B	East Yorks, Yorkshire	Mr. L. Dougal Callander (Doncaster) Dr. W. N. West Watson (Bradford)	1
C	Isle of Man, Lancashire and Cheshire	Professor A. H. Burgess (Cheadle Cheshire) Dr. J. S. Manson (Warrington)	2
D	Derbyshire Leicester and Rutland, Lincolnshire, Nottingham	No nomination	1
E	Bedfordshire Cambridge and Huntingdon, Essex, Hertfordshire Norfolk, Northamptonshire Suffolk	Dr. J. W. Bone (Luton)	1
F	Berks Bucks, and Oxford, Birmingham Staffordshire	Dr. S. Wand (Birmingham)	1
G	North Wales, Shropshire and Mid Wales	Dr. J. R. Prytherch (Llangefni)	1
H	South Wales and Monmouthshire	Dr. W. E. Thomas (Ystrad Rhondda)	1
I	Metropolitan Counties	Dr. L. G. Glover (Hampstead) Dr. F. Gray (Wandsworth) Dr. H. Robinson (South Kensington) Mr. R. Scott Stevenson (London, W. I.) Mr. H. M. Stratford (Kensington) Dr. G. de Swiet (North Kensington)	4
J	Bath, Bristol and Somerset, Gloucestershire, Worcestershire and Herefordshire	Dr. J. Middleton Martin (Cheltenham)	1
K	Dorset and West Hants South Western Wiltshire	No nomination	1
L	Southern, Surrey	Mr. N. E. Waterfield (Great Bookham, Surrey)	1
M	Kent, Sussex	Dr. E. R. Fothergill (Hove)	1
N	Aberdeen Dundee Northern Counties of Scotland, Perth	No nomination	1
O	Edinburgh, Fife	Dr. John Hunter (Edinburgh)	1
P	Glasgow and West of Scotland Branch (Glasgow Division)	Mr. W. J. Richard (Glasgow)	1
Q	Border Counties, Glasgow and West of Scotland (Five County Divisions) Stirling	Dr. J. B. ... (Glasgow)	1
R	Northern Ireland		

The candidates referred to in Groups A, C, E F, G, H, J, L, M O, P, Q and R, being the only candidates nominated for these Groups, are hereby declared elected Members of Council for 1937-8

Voting papers will be posted to all members of the Association in Groups B and I, where there are contests, from the Head Office on Saturday May 8 1937 they are returnable not later than Saturday, May 15 1937, to the Medical Secretary, British Medical Association House, Tavistock Square, London, W C 1

No nominations having been received for Groups D, K and N it rests, under the by-laws, with the Council either again to invite nominations from members in the Groups or itself to elect members to fill the vacancies

Election of 2 Members of Council by Public Health Service Members

The following being the only candidates nominated for election as Members of Council for 1937-8 by Public Health Service members, are hereby declared elected Members of Council for 1937-8

Meetings of Branches and Divisions

BIRMINGHAM BRANCH WARWICK AND LEAMINGTON DIVISION

A meeting of the Warwick and Leamington Division was held at Leamington Spa on April 8 when Dr GEORGE BRAY delivered a British Medical Association Lecture on Allergic Diseases. Dr Bray pointed out that the combination of an allergic hereditary disposition and a specific sensitizing substance which might be absorbed by inhalation ingestion injection contact, etc. produced the allergic reactions. He discussed the non specific catalysing factor which might be dietary environmental nasal toxic psychotic etc. Most allergic conditions he said manifested themselves during the first decade of life. Allergic patients had commonly more than one manifestation. The lecturer then discussed treatment. Dr Bray illustrated his remarks by lantern slides which added greatly to the interest of the lecture and at the close he showed a film dealing with the cutaneous manifestations of allergy. The lecture was greatly appreciated by an enthusiastic audience and after a short discussion in which Drs E. L. EDMONDSON J. A. KNOTT and J. G. WARDROP took part Dr Bray was very warmly thanked for his lecture and demonstration to which non members of the Association resident in the area of the Division had been invited.

After the lecture members of the Division attended an informal dinner. This proved to be a most enjoyable and successful function and it is hoped to make it an annual event.

EAST YORKSHIRE BRANCH

At a meeting of the East Yorkshire Branch held at Hull on April 14 with Dr S. F. FOURACRE in the chair Dr F. C. EVE opened a discussion on Allergic Diseases. He said that allergy manifested itself in several groups of diseases (1) spasm of plain muscle—asthma colics migraine (2) increased permeability of tissues—hay fever angioneurotic oedema and (3) anaphylaxis. Allergic asthma occurred between the ages of 6 months and 50 years. It was necessary to detect the allergen and to eliminate it from the patient's surroundings or food, or to educate the body to it gradually. Allergy gradually increased the body resistance from a low to a high tolerance of bacteria. The various theories of the nature and meaning of allergy were not satisfactory. Dr EVE continued and he suggested that it was a product of civilization. Nowadays human beings required a widely responsive nervous system. Disease germs were internationalized became more virulent and varied. Allergic diseases were rare in Chinese and several less civilized parts of the world. In Switzerland hay fever was five times as prevalent in the towns as in the country. He recommended a return to the habits of our forefathers—less clothing, raw fruit, and the active life of the husbandman but he questioned its feasibility.

Dr H. M. LEETE read a short paper on serum sickness and anaphylaxis. Serum sickness was much less prevalent now than it was a few years ago. It was more common after injections given in cases of scarlet fever than after injections given in cases of diphtheria. Diphtheria was not treated with A.P.T. or toxoid antitoxin and accounted for the fewer cases. Intramuscular injections were safe but one dose was given intravenously and caused fatal anaphylaxis. The usual safe period of ten days between injections was too long, only four days being really safe. Dr Leete did not recommend horse serum in non-specific cases. Anaphylactic experiments on animals were described—guinea pigs dying of respiratory failure and rabbits with right-sided heart failure—thus suggesting that histamine-sensitive cells had different situations in different species.

Dr E. M. DEARN followed with a short paper on hay fever vasomotor rhinitis, and the nasal factor in asthma. He briefly described the history of hay fever and stressed the importance of the work of C. H. Blackley in the nineteenth century. The aetiology was considered and also the factors influencing the severity of the hay fever season. The pre seasonal treatment of cases with pollen extracts was recommended as being more efficacious than similar treatment during the season. Among palliative measures Dr Dearn had found zinc ionization very useful. In considering the nasal factor in asthma Dr Dearn described the normal physiology and functions of the nose. The trigger or asthmogenic area of the nose was described and also the effect of septal deviations nasal polypi or the discharge from infected sinuses in causing reflex action. Statistics showed that nasal abnormalities could rarely be a cause of asthma although allergy was a frequent cause of nasal pathology.

A discussion followed in which other members took part.

EDINBURGH BRANCH SOUTH EASTERN COUNTIES DIVISION

At a meeting of the South Eastern Counties Division held at Galashiels on April 14 with Dr J. J. McMILLAN in the chair there was discussion on the remuneration of insurance practitioners and the extension of medical benefit to adolescents. The secretary was instructed to arrange a golf meeting within the Division in connexion with the Treasurers Cup competition the winner, under handicap to qualify for the final at Belfast.

KENT BRANCH EAST KENT DIVISION

At a meeting of the East Kent Division held at Cliftonville on April 22 with Mr W. E. C. WYNNE in the chair Mr JOHN HOSFORD gave an address on 'The Modern Treatment of Fractures'. The lecture was illustrated by the B.M.A. film on fractures. There was a good attendance, and members showed their appreciation of the lecture and the film in the long and stimulating discussion which followed. The meeting closed with a hearty vote of thanks to Mr Hosford for his address.

METROPOLITAN COUNTIES BRANCH CHELSEA DIVISION

A general meeting of the Chelsea Division to which all medical practitioners in Chelsea and Fulham had been invited was held in the Town Hall, Fulham on April 22 with the chairman, Dr FAIRFIELD THOMAS presiding. Dr N. W. HAMMER, one of the medical experts of the Air Raid Precautions Department of the Home Office, opened a discussion on the medical practitioners duties in air raids. Dr SCOTT, medical officer of health for Fulham described the steps which were being taken by the borough and the work yet to be done in establishing first aid parties and posts and instituting gas proofing of houses also courses of instruction through the B.M.A. for private practitioners. The CHAIRMAN raised the questions of the book issued by a group of Cambridge scientists contamination of water supplies and the risk of contaminating public vehicles. In reply, Dr HAMMER stated that the book was scientifically open to objection the conditions under which the experiments had been performed not being comparable to the contingencies which were under consideration by the Government. Medical practitioners were strongly urged to obtain the necessary instruction since there would be a heavy call on their services. The improvised precautionary measures adopted in Madrid had proved very effective in reducing the number of casualties. Dr GIBSON added that courses of instruction of medical practitioners had been much appreciated in Kensington. Dr HANNAH ANDERSON expressed the gratitude of the meeting to the speakers for a most comprehensive and enlightening survey of the position and votes of thanks were adopted unanimously on the proposition of Dr FAIRFIELD THOMAS seconded by Dr SCOTT.

SOUTHERN BRANCH GUERNSEY AND ALDERNEY DIVISION

At a meeting of the Guernsey and Alderney Division held at Grange on April 16 with Dr B. S. COLLINGS in the chair Professor A. FLEMING delivered a British Medical Association Lecture on 'Biological Conditions which Interest Private Practice'. There was a good attendance and the lecture proved most interesting and instructive. A discussion followed in which most members took part and the wish was expressed that the Division could have the pleasure and advantage of more such meetings. The thanks of the Division were conveyed to Professor Fleming for his address and to Headquarters for arranging the lecture. At the close of the meeting the chairman entertained the members to refreshments at his house which was much appreciated.

SOUTHERN BRANCH ISLE OF WIGHT DIVISION

At the annual meeting of the Isle of Wight Division held at the Royal Isle of Wight County Hospital Ryde on March 19 the following officers were elected.

Chairman Dr Ivor Tuckett. *Vice Chairman* Mr T. A. Mayo. *Honorary Secretary and Treasurer and Representative in Representative Body* Dr H. S. Howe. *Wood Deputy Representative in Representative Body* Mr J. J. O'Donoghue.

A cordial invitation was issued to the Southern Branch to hold the annual meeting on the island on Saturday, June 12. An attractive week-end programme is being arranged and an invitation to the Medical Secretary, Dr G. C. Anderson to be the guest of the Division for the week-end was renewed.

The honorary secretary's annual report was approved.

A clinical meeting followed at which the following cases were shown Mr J A GAVNOR elephantiasis Mr F WILSON Harlow chronic appendicitis acute retention of urine and hypernephroma Dr HOWIE Wood, erythrocytosis crurum puellaris and a skin case for diagnosis Mr A C LIESCHING, conservative treatment of acute osteomyelitis

SOUTHERN BRANCH PORTSMOUTH DIVISION

A meeting of the Portsmouth Division was held at Southsea on March 11 when Dr B W M ASTON KEY was in the chair and fifty nine members were present of whom forty four sat down to the preceding supper

A resolution of the Executive Committee "that the Portsmouth Division of the British Medical Association can see no advantage in adopting a scheme for the treatment of cancer patients which would include the formation of a Tumour Clinic which had been circulated to all members of the Division was put to the meeting for consideration Dr H W JANS and Mr C A SCOTT RIDOUT spoke in favour of the resolution, which was carried without dissent

Dr F W PRICE read a paper entitled A General Talk on Heart Disease including a Reference to Child bearing as a Complication Dr PRICE gave as the main causes of heart disease rheumatism syphilis masked hyperthyroidism hypertension chronic valvular disease chronic myocardial disease, angina, and atheroma and dealt at some length with each of those conditions He then discussed general treatment and touched upon some operative procedures, including total thyroidectomy sympathectomy and injection of the dorsal nerve roots Dr J R B HERN Mr SCOTT RIDOUT Dr H. FARNCOMBE and Dr R J LYTLE took part in the subsequent discussion, and Dr PRICE replied to each speaker individually On the motion of Dr LYTLE seconded by Dr D G COOPER a hearty vote of thanks was accorded Dr PRICE for his address

SURREY BRANCH KINGSTON-ON THAMES DIVISION

At a meeting of the Kingston on Thames Division held at Mitcham on April 13, with Dr A. S. HOLLINS in the chair, Wing Commander H. M. STANLEY TURNER read a paper on Some Dangers of Pleasure Cruising in which he reminded his hearers of the risks run by large parties of tourists entirely ignorant of the first rules of tropical hygiene, when they descended lightly heartedly on regions where malaria, sprue, sandfly fever, kala azar and filariasis were endemic and sanitation was practically nil After a short epitome of the symptoms and signs of the various diseases the meeting closed with a film on malaria presented by the courtesy of Bayer Products Ltd.

SURREY BRANCH RICHMOND DIVISION

At a clinical meeting of the Richmond Division held at Richmond Royal Hospital on April 9 with Lieut-Colonel E. L. GOWLAND in the chair, Mr J W HEEKES showed specimens and read notes on a number of cases of carcinoma of the uterus and breast Dr JENKINS demonstrated a number of radiographs of cases where the diagnosis was obscure, and Mr HAROLD DODD took members round the wards to show them a number of cases of interest Tea was provided by the Hospital Committee and the meeting ended with a vote of thanks to all those who had shown cases

UNITED PROVINCES BRANCH

At a meeting of the United Provinces Branch held at King George's Medical College Lucknow on February 20 with Lieut-Col R S TOWNSEND IMS in the chair the following clinical cases were demonstrated or described

1 Dr E A. DOUGLAS vagitus uterinus in a primipara aged 32 transverse presentation foetus delivered by forceps The baby was born asphyxiated but soon recovered the pre birth cry was distinctly heard twice A discussion followed in which Dr G MARCHANT and Dr B G S ACHARYA took part

2 Captain K. S. NIGAM (a) stabbed wound of the chest resulting in diaphragmatic hernia of spleen and (b) artificial tooth plate accidentally swallowed impacted at the lower end of the oesophagus half being removed with the oesophagoscope and the other half being pushed into the stomach, whence it was passed with the forceps

3 Captain R D ALEXANDER coronary thrombosis.
4 Dr H K RUSTOGI angioneurotic oedema with well marked swelling of the prepuce also a skigram of a suspected case of pituitary tumour

The PRESIDENT then introduced the Medical Secretary Dr G C. ANDERSON, who in a short speech described the aims and objects of the British Medical Association Dr Anderson emphasized the necessity of joining a well-organized medical association and of taking an active interest in the social, ethical, and medico-political problems of the day The address was much appreciated and Captain NIGAM Dr VIAS Colonel H. STOTT and Dr S S BOSE took part in the discussion which followed Colonel TOWNSEND thanked Dr Anderson on behalf of every one present for the great trouble that he had taken in touring India to study the professional difficulties of the medical practitioners of that country and for the interesting address that he had delivered

YORKSHIRE BRANCH GOOLE AND SELBY DIVISION

Meetings of the Goole and Selby Division were held on March 2, 10, and 23 when consideration was given to the scale of fees payable to medical practitioners for attendance on members of juvenile clubs, and at the last meeting a resolution was unanimously adopted concerning the matter It was arranged to supply every doctor in the area with a copy of a circular letter for transmission to any club for which he acts as medical officer

YORKSHIRE BRANCH SHEFFIELD DIVISION

The annual luncheon to newly qualified practitioners in Sheffield was held at the Royal Victoria Hotel on March 24 the hosts being the executive committee of the Sheffield Division. Among the twelve guests was Dr Margaret Bell who had achieved the unusual distinction of gaining first-class honours in the Final M.B. Ch.B. examination at Sheffield University The chairman of the Division, Mr PERCIVAL HAY was in the chair, and Dr R. E. PLEASANCE proposing the toast of "Our New Colleagues" said it was always a pleasure to welcome new blood into the profession especially when it was of such good quality Dr Bell and Dr I. B. SNEDDON had gained gold medals in clinical medicine and anaesthetics respectively Passing the final examination brought with it the realization of how little one knew, and that, although legally qualified to practise one had no experience The question arose of what to do next? Some might choose to become ship surgeons as affording an opportunity of seeing the world pleasantly and cheaply Others might wish to enter general practice so as to earn a little money as soon as possible A third and preferable alternative was to secure a hospital appointment in order to gain experience In any case there were certain things that all the newly qualified practitioners ought to do First they should join a medical defence organization without delay Secondly they should join the British Medical Association Graduates admitted to membership before the expiration of two years from the date of registration under the Medical Acts were entitled to receive all the privileges of membership for £1 11s 6d. per annum which was half the usual subscription This reduced rate applied until December 31 next occurring after the expiration of four years from the date of such registration The privileges included the receipt of the *British Medical Journal* weekly Lastly they should keep in touch with their old University and if remaining in Sheffield should join the Sheffield Medico-Chirurgical Society, of which the local practitioners were justly proud

Dr IAN B. SNEDDON replying to the toast said that he was pleased to have the opportunity of thanking the teaching staff for all they had done. He had found in the Sheffield Medical School an atmosphere of kindness that was very encouraging and which he hoped would not be lost as the school increased in size and in fame Dr BELL proposed the toast of "The Teaching Staff of the Medical School" and Mr VINCENT TOWNROW replied The toast of The Chairman was proposed by Mr ERNEST FINCH and Mr HAY in replying wished all his new colleagues a very successful career and a happy future

YORKSHIRE BRANCH YORK DIVISION

At the annual meeting of the York Division, held on April 10 the following officers were elected

Chairman Dr S G PLATT Vice-Chairman Dr W McKIM
Honorary Secretary Dr L A. JOHNSON Charities Secretary Mr G S Hughes Representative in Representative Body Dr Peter MacDonald

The CHAIRMAN welcomed the president of the Yorkshire Branch Mr L. DOUGAL CALLANDER, who addressed the meeting on matters of interest to the Division

MANCHESTER AND SALFORD HOSPITAL FOR DISEASES OF THE SKIN—Two A.M.O.s Salaries £100 p.a. each

MIDDLESEX COUNTY COUNCIL—J.R.A.M.O. for Hillingdon County Hospital Uxbridge Salary £250 p.a.

MIDDLESEX HOSPITAL W.—(1) J.M.O. (male) for the Radiotherapy Department Salary £300 p.a. (2) Whole-time Assistant (male) for the Physical Medicine Department Salary £300

MORPETH STANNINGTON CHILDREN'S SANATORIUM—Locumtenent (female) Salary £7 7s per week.

NEWPORT ROYAL GWENT HOSPITAL—H.S. (male) Salary £135 p.a.

NORTHWOOD MOUNT VERNON HOSPITAL—Clinical Pathologist Salary £500 p.a.

NORWICH CITY—Assistant M.O.H. and Assistant School M.O. Salary £600-£25 £700 p.a.

NOTTINGHAM GENERAL HOSPITAL—(1) H.S. for Ear Nose and Throat Department (2) Two R.C.O.s (males) Salaries £150 p.a. each

NOTTINGHAMSHIRE COUNTY COUNCIL—Assistant School M.O. (male) Salary £500-£25 £700 p.a.

OLDHAM COUNTY BOROUGH—(1) Whole time Assistant School M.O. (male) Salary £500-£25 £700 p.a. (2) R.A.M.O. (unmarried) for the Municipal Hospital Salary £200 p.a.

OLDHAM ROYAL INFIRMARY—H.S. Salary £175 p.a.

OXFORD EYE HOSPITAL—H.S. to the Ophthalmic Department. Salary £150 p.a.

PLAISTOW MATERNITY HOSPITAL—(1) R.H.S. Salary £75 p.a. (2) Consulting Paediatrician Honorarium £20 and a fee of £2 2s per lecture

PLYMOUTH PRINCE OF WALES'S HOSPITAL—(1) Hon P (2) Hon P with charge of Out patients (3) Hon Ophthalmic S

PLYMOUTH PRINCE OF WALES'S HOSPITAL Devonport—J.H.S. Salary £120 p.a.

PLYMOUTH PRINCE OF WALES'S HOSPITAL Greenbank Road—(1) R.S.O. (male) (2) H.S. Salaries £225 p.a. and £120 p.a. respectively

QUEEN CHARLOTTE'S MATERNITY HOSPITAL Marylebone Road N.W.—(1) A.R.M.O. (male) (2) Resident Anaesthetist and District R.M.O. (3) Resident Anaesthetist Salaries £80 p.a., £90 p.a. and £100 p.a. respectively

QUEEN'S HOSPITAL FOR CHILDREN Hackney Road E—H.S. Salary £100 p.a.

READING ROYAL BERKSHIRE HOSPITAL—(1) C.O. (2) H.S. to the Special Departments Males Salaries £150 p.a. each

ROTHERHAM HOSPITAL—Casualty H.S. (male) Salary £150 p.a.

ROYAL CHIST HOSPITAL City Road E.C.—Clinical Assistant

ROYAL FREE HOSPITAL Gray's Inn Road W.C.—(1) Senior R.M.O. (male) Salary £150 p.a. (2) Assistant P

ROYAL WATERLOO HOSPITAL FOR CHILDREN AND WOMEN Waterloo Road S.E.—(1) R.C.O. (2) H.S. Males Salaries £150 p.a. and £100 p.a. respectively

RUNWELL HOSPITAL FOR NERVOUS AND MENTAL DISORDERS—H.P. Salary £150 p.a.

S.LISSURY GENERAL INFIRMARY—R.M.O. (male) Salary £250 p.a.

SHEFFIELD CITY—A.M.O. (female) for Nether Edge Hospital Salary £350-£25-£450 p.a.

SHREWSBURY ROYAL SALOP INFIRMARY—R.H.S. (male un married) Salary £160 p.a.

SOUTHALL—NORWOOD HOSPITAL—R.M.O. (male unmarried) - Salary £125 p.a.

SOUTHAMPTON ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL. (1) Senior H.S. Salary £200 p.a. (2) H.P. (3) I.S. (4) Resident Anaesthetist and H.S. to the Ear Nose and Throat Department. (5) C.O. Salaries £150 p.a. each Males unmarried

STOKE-ON-TRENT BURSLEM HAYWOOD AND TUNSTALL WAR MEMORIAL HOSPITAL—R.H.S. Salary £175 p.a.

STOKE-ON-TRENT NORTH STAFFORDSHIRE ROYAL INFIRMARY—H.S. for Aural and Ophthalmic Department Salary £150 p.a.

STOURBRIDGE CORBETT HOSPITAL—H.S. Salary £100 p.a.

STROUD GENERAL HOSPITAL—R.M.O. Salary £160 p.a.

SUNDERLAND ROYAL INFIRMARY—(1) Two H.S. (2) H.P. Males Salaries £120 p.a. each

SURREY COUNTY COUNCIL—(1) Whole time Resident Medical Superintendent (male) for Botleys Park Colony near Chertsey Salary £1 000-£50-£1 375 p.a. (2) A.M.O. (male) (3) J.A.R.M.O. for the County Sanatorium Milford Salaries £600-£20-£700 p.a. and £350 p.a. respectively

TAUNTON AND SOMERSET HOSPITAL—H.P. Salary £100 p.a.

UNIVERSITY COLLEGE HOSPITAL Gower Street W.C.—Hon P in Charge of the Department for Physiotherapy

VICTORIA HOSPITAL FOR CHILDREN Tite Street S.W.—Physiotherapist Honorarium £50 p.a.

WEIR HOSPITAL Grove Road Balham S.W.—J.R.M.O. (male un married, Salary £150 p.a.

WEST HAM COUNTY BOROUGH—(1) M.O.H. and School M.O. (male) Salary £1,500-£50-£1 750 p.a. (2) Second A.M.O. (male) for Central Home Leytonstone E Salary £350-£25 £450 p.a.

WEST SUFFOLK COUNTY COUNCIL—Assistant County M.O. and Assistant School M.O. Salary £500-£25 £700 p.a.

WOLVERHAMPTON COUNTY BOROUGH—R.A.M.O. (male, unmarried) for New Cross Hospital Salary £200 p.a.

WOLVERHAMPTON ROYAL HOSPITAL—H.S.s (unmarried) Salaries £100 p.a. each

WOOLVICH AND DISTRICT WAR MEMORIAL HOSPITAL Shooters Hill Hill S.E.—(1) Surgical Registrar Honorarium £100 p.a. (2) Three Hon Anaesthetists

CERTIFYING FACTORY SURGEON—The appointment at Longridge (Lancashire) is vacant Applications to the Chief Inspector of Factories Home Office Whitehall S.W.1 by May 18

To ensure notice in this column advertisements must be received not later than the first post on Tuesday mornings

Notifications of offices vacant in universities medical colleges and of vacant resident and other appointments at hospitals will be found at pages 44 45 46 47 48 49 50 51 54 and 55 of our advertisement columns and advertisements as to partnerships assistantships and locumtenencies at pages 52 and 53

APPOINTMENTS

LONDON COUNTY COUNCIL.—The following appointments are announced at the hospitals indicated in parentheses *Second Assistant Medical Officers* Eric D. Sands, M.R.C.S. M.R.C.P., D.P.M. (Claybury) James S. Allen M.B. B.Ch., B.A.O., D.P.M. (The Manor Epson)

UNIVERSITY COLLEGE HOSPITAL Gower Street, W.C.—*Assistant Surgeon to the Royal Ear Hospital* Stephen C. Suggett M.B., B.S. F.R.C.S.

CERTIFYING FACTORY SURGEONS—C. F. Fairlie M.D., for the Blyth District (Northumberland) A. K. James M.B., Ch.B., for the Calne District (Wiltshire) C. S. Lewis M.R.C.S. L.R.C.P. for the Staveley District (Derbyshire) G. W. Scott M.D. for the Malvern District (Worcestershire) J. D. B. Vaile M.R.C.S. L.R.C.P., for the Chertsey District (Surrey)

BIRTHS, MARRIAGES, AND DEATHS

The charge for inserting announcements of Births Marriages and Deaths is 9s which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue

MARRIAGE

MADDOX—GILLESPIE.—On April 10 1937 at Upton Parish Church Chester Denis Simpson Maddox to Isabella Anne Gillespie M.B. Ch.B., D.P.M.

DEATH

CRUICKSHANK.—On April 14 at 9 Soho Road Handsworth, Birmingham (suddenly) George Birrell Cruickshank, husband of Margaret Wilkie M.B. Ch.B.

J T INGRAM AND MICHAEL C OLDFIELD HEREDITARY SEBACEOUS CYSTS

FIG 7.—Case II. Walter T. Head and front of chest, showing cysts in region of right eyebrow and scar over front of sternum

FIG 8.—Case II. Back of chest, showing two cysts to the left of the mid line.

FIG. 9.—Case IV. William T., Dorothy's father. Showing multiple sebaceous cysts on forehead and scalp

FIG 10.—Case IV. Showing cysts on the face and scalp

Radiograph of pelvis and thighs

patients complain early of pains in the bones, particularly in the back, pelvis, and legs. Deformities of the skeleton appear and slowly progress. They are of the type commonly seen in conditions associated with softening of the skeleton. The thoracic cage and pelvis are often grossly deformed, and the spine is shortened owing to narrowing of the vertebral bodies. Kyphosis occurs, with loss of several inches in height. The chest has a deep antero-posterior diameter and distorted ribs, and the abdomen is shortened. The limbs may be irregularly curved and deformed, so that walking becomes at first difficult and then impossible. Occasionally bone tumours or cysts are visible or palpable, especially when they appear in the limbs or jaws. The fingers may show a characteristic deformity, in which the terminal phalanges become shorter and broader than the normal. The appetite fails, there are nausea and vomiting, and the patient becomes extremely weak and may go on to a cachectic state with extreme deformity and helplessness. Treatment at this stage of the disease will not restore the normal function of the skeleton, and it should be our aim to make the diagnosis of hyperparathyroidism before such complications have arisen.

TYPE WITH OSTEOPOROTIC SKELETON

The skeletal changes in this type may be indistinguishable from those of osteomalacia, hyperthyroidism or senile osteoporosis. In all such cases studies of the blood chemistry and the calcium balance are essential.

TYPE WITH RENAL CALCULI

The presenting symptom in this type may be renal colic or haematuria. Skeletal changes may be absent, minimal, or severe. In all patients with renal calculi, especially where they are bilateral, the serum calcium and plasma phosphorus should be estimated in order to rule out hyperparathyroidism.

TYPE WITH METASTATIC CALCIFICATION OF THE KIDNEYS

In this type calcium phosphate is deposited in the substance of the kidney and can be demonstrated in radiographs. Chronic nephritis occurs and as it progresses the plasma phosphorus may rise and the increased excretion of calcium salts may be diverted from the urine to the faeces. Patients with this type of renal lesion may be wrongly diagnosed as cases of chronic nephritis.

Radiological Features

Radiologically the most striking feature is the great lack of calcium salts throughout the skeleton. The cortex of the bone loses its ivory character and may be reduced to a thin uneven linear shadow. The medulla becomes less dense with receding recalcification of the bone pattern at first but later cancellous bone tends to fade entirely. In the skull there is a uniform milky granular mottling with small translucent cyst-like areas. The vertebrae may become biconcave like fish vertebrae and they are then reduced in height. There may be evidence of cysts but these only rarely expand the cortices. At times the cysts are difficult to see so great is the lack of calcium in the surrounding bone. The cystic changes come on late in the disease and their presence is not essential to diagnosis. All the bones of the body may be affected even the phalanges of the hands and feet. Areas of subperiosteal resorption in the long bones and phalanges are common. The pelvis undergoes pressure deformities due to the thrust of the femoral heads; cyst-like areas are common in the pelvic bones. The femora and ribs may bend and collapse.

In estimating the density of the radiographic shadows of bones it is found necessary to use a controlled method. A control subject is chosen of the same sex, age, weight, height and build as the patient. The corresponding limbs of patient and control are placed side by side and exposed simultaneously on the same negative. Where a series of radiographs is taken in one patient the same control subject is used each time. The urinary tract should always be examined for calculi. Where metastatic calcification has occurred in the kidneys it will show in radiographs. On examination of the chest and neck it must be borne in mind that a parathyroid tumour may vary greatly in size and position, and that its shadow may be found in the mediastinum.

Calcium and Phosphorus Metabolism

Increased production of the parathyroid hormone leads to characteristic changes in the calcium and phosphorus metabolism. The serum calcium is raised, and the figures vary between 12.6 and 23.6 mg per 100 ccm. Values as high as 14 mg per 100 ccm are not uncommon. Any serum calcium figure of 11 mg per 100 ccm should be regarded as suspicious, and therefore be repeated. The plasma phosphorus figure is low and may vary between 1 and 2.7 mg per 100 ccm. The combination of this high calcium and low phosphorus figure almost always indicates hyperparathyroidism but in cases in which there is renal impairment the plasma phosphorus figure may become elevated. The plasma phosphatase figure is raised in all cases of hyperparathyroidism in which bone disease can be detected. There are cases without detectable bone disease in which the plasma phosphatase is normal.

An increased calcium excretion in the urine is always present and varies from slightly above the normal to eight times the normal figure. In an uncomplicated case the increased calcium excretion is entirely urinary, the faecal excretion being unaffected. In individuals with renal impairment, however, part of the increased excretion is faecal. There is also an increased urinary phosphorus excretion.

Differential Diagnosis

If the history and physical signs are suggestive of hyperparathyroidism complete confirmation of the diagnosis may usually be obtained in the chemical findings—namely, a high serum calcium, low plasma phosphorus and increased calcium excretion in the urine. In more difficult cases removal of a portion of bone for histological section may be necessary. Without such chemical or histological confirmatory evidence it is not justifiable to explore the parathyroid glands.

The following skeletal diseases are sometimes confused with hyperparathyroidism: osteomalacia, senile osteoporosis, thyrotoxic osteoporosis, osteitis deformans, osteoporosis with renal glycosuria, secondary carcinomatosis of the skeleton, multiple myelomatosis, osteogenesis imperfecta, renal rickets, focal osteitis fibrosa, dyschondroplasia with multiple enchondromata (Ollier's disease), xanthomatosis of bones (Schüller-Christian's disease) and Gaucher's disease.

Treatment

By means of a high calcium and high phosphorus diet it is possible to demonstrate improvement in skeletal calcification but such treatment is contraindicated because it increases the danger of renal complications. No beneficial clinical or metabolic results have been observed in the treatment of hyperparathyroidism by x-irradiation. The treatment is surgical. The parathyroid tumour itself has been palpable in less than 20 per cent of cases.

Even the largest tumour removed, which measured 7.5 by 5 by 1.8 cm and weighed 26.2 grammes, could not be felt in the neck as it was behind the trachea. The patient should be prepared for operation by giving for some weeks a high calcium diet and vitamin D. The neck should be explored through a collar incision and the four sites of the parathyroids examined. The chief operative difficulty is that of finding the tumour. Search must be made from the bifurcation of the carotids to the arch of the aorta. If a single parathyroid tumour is discovered it should be excised but if two tumours are found there is some risk in removing both. In at least six cases the tumour has been removed from the mediastinum. In eight cases two parathyroid tumours were removed, five of the patients survived this drastic treatment and the other three died in tetany. In three cases subtotal parathyroidectomy was performed for the good reason that in each of them two normal parathyroid bodies had already been excised.

When no tumour at all has been discovered removal of one or two normal parathyroid glands has had no permanent good effect. Such an operation does not in fact seem to be permissible for in every case of hyperparathyroidism yet recorded there has been a tumour measuring at least 0.7 cm in its greatest diameter. Moreover, 30 per cent of the deaths recorded after operation have been due directly or indirectly to interference with one or more normal parathyroid bodies. In less than 4 per cent of recorded cases has death immediately followed operation but in 10 per cent tetany or a renal complication killed the patient at periods varying from nineteen days to fourteen months later. Even if we allow that unsuccessful ventures do not always find their way into print the operative mortality is not high, and this in spite of the fact that the technical problems confronting the surgeon may be complicated. Thus in 1931 Walton reported a case in which search in the usual sites of parathyroid glands did not reveal a tumour and a small mass in the lower part of the thyroid gland was removed in the belief that it might be a parathyroid tumour. However on section this proved to be thyroid tissue, and since its removal was not attended by any material chemical changes in the blood Walton opened the wound five days later. He then incised a deep layer of the cervical fascia which forms the bed of the thyroid gland and two parathyroid tumours were found and removed. One tumour was lying behind the oesophagus and the second—and larger—retrosternal tumour was lying in front of the second and third thoracic vertebrae. Since learning of this experience others have realized that previous unsuccessful explorations have been incomplete. In one such case seven exploratory operations were performed in the course of six years the tumour being found ultimately only by dividing the sternum (Churchill and Cope 1934). The ordinary post operative treatment should include a high calcium diet, vitamin D, and ultra-violet irradiation. Rarely in cases in which giant-celled tumours have destroyed a bone amputation is necessary. Operation upon the kidneys may be required for renal calculi.

EFFECTS OF TREATMENT

Removal of a parathyroid tumour brings about dramatic changes. Many crippled patients have been able to dispense with sticks and crutches. Usually for some reason not yet clear, pain in the bones goes away immediately. Spontaneous fractures often heal as readily as cases of fractures in healthy bones. Decrease in size of osteoclastic tumours of bone within a few weeks of operation on the neck has now been many times recorded. The

effect of treatment in increasing the density of bone is really remarkable, and controlled radiographs have demonstrated this point now many times. There is marked gain in weight. It is interesting to note that the symptomatic changes bear no relation to the size of the tumour. Thus a woman of 37 after four years of total crippledness including great bone deformities and destruction of hip-joints and shoulder-joints, had a tumour weighing only 1.3 grammes removed, and is now able to walk with sticks and to sew and knit.

As a rule the level of the serum calcium and plasma phosphorus and the excretion of calcium and phosphorus in the urine are restored to normal. Sometimes, indeed, there is temporary hypocalcaemia and even oliguria. Latent tetany after operation has been common, and manifest tetany has often occurred—followed by death in four cases. In one published case tremor and acute mania came on three weeks after operation, at a time when the serum calcium had dropped to 6.6 mg per 100 c.c., but the condition was completely relieved in three days by giving injections of the parathyroid hormone in conjunction with a preparation of calcium administered intravenously. This must undoubtedly be regarded as the essential treatment of severe post operative tetany after removal of a parathyroid tumour.

VOLUNTARY HOSPITALS. A FEDERATION SCHEME

RECOMMENDATIONS OF SANKEY COMMISSION*

Nearly two years ago at its annual conference the British Hospitals Association resolved to appoint a Commission to consider the present position of voluntary hospitals and how far, in view of legislative and social developments, steps should be taken to promote their interests and safeguard their future. A commission of ten members was set up under the chairmanship of Viscount Sankey. The members of the medical profession on the Commission were Sir Henry Brackenbury, Professor L S Dudgeon, Colonel D J Mackintosh and Provost A W Sheen, and the others were Miss Bartleet, an alderman of the Birmingham City Council, Mr Alan Davies a former mayor of Wolverhampton, Mr H L H Hill a past-president of the Institute of Chartered Accountants, Miss E M Musson, chairman of the General Nursing Council, and Sir Reginald Poole a past president of the Law Society. Mr R H P Orde, secretary of the British Hospitals Association, acted as honorary secretary.

The Commission began its work in January, 1936 and it was intimated that a report might be expected by the following June. The fact that the Commission has taken fifteen months over its report indicates the complexity of its task. The hearing of evidence occupied twenty-one sittings. The Royal Colleges, the British Medical Association (through Dr Peter Macdonald, chairman of the Hospitals Committee, and Dr Charles Hill, Deputy Medical Secretary), the Medical Superintendents Society, the

* Report of the Voluntary Hospitals Commission. British Hospitals Association, 12, Grosvenor Crescent, London SW1 (its net is 2d post free).

Socialist Medical Association, and the College of Nursing were among the bodies which tendered evidence

General Survey

The report begins with a tribute to the voluntary system. The strength of that system resides in the spirit of co-operative endeavour which inspires it and in the freedom of administration which it permits. It is in such an atmosphere that medical education, for which the voluntary hospital system has long been responsible, best flourishes. But the system has its weaknesses, chiefly the difficulty and uncertainty of finance. Its position is affected by the rise of the public authority system of hospital and health services, but there seems to be no reason why for many years to come the two systems should not advantageously exist side by side, learning from and co-operating with each other. Some form of co-operation was projected under the Local Government Act 1929, but the obstacle to bringing such co-operation about is the looseness of the organization on the voluntary side. The thousand voluntary hospitals in this country, unlike the council hospitals, have no adequate authority to bring them together for corporate discussion in their respective regions with official bodies.

In a leading article in the *British Medical Journal** at the time the Commission was set up it was suggested that its most important task would be to recommend a suitable form of organization and machinery of both a regional and national character for bringing about some kind of federation among voluntary hospitals. The difficulties, however, were not disregarded. Areas differ in character. Local pride and enthusiasm are important elements in hospital support. In certain towns there is rivalry, with its good and harmful aspects, between the hospitals. Methods of management and monetary collection are varied. Elasticity in detail must be maintained, regimentation and bureaucratic control avoided. It would not be possible to reduce all hospitals to a common denominator and exceedingly unwise if it were. Moreover some hospitals are redundant and yet must be preserved. Donors and testators cause buildings to be erected and endowed in places already amply served, or build hospitals without providing for their equipment still less for their maintenance so that the neighbourhood is saddled with the necessity for charitable appeals. One of the principal things that a body which could speak for all hospitals in a locality might do would be to educate hospital benefactors.

Co-operation Among Hospitals

The outstanding recommendation of the Commission is that the country should be divided into regions corresponding presumably to the present regions of the British Hospitals Association (of which there are twenty-three, one of them covering the whole of Scotland) and that in each region there should be a council to correlate hospital work and needs. These bodies would have no coercive powers but they would of course exercise a good deal of authority. To avoid inconsistency and diversity of decisions as between regional councils it is also proposed that a central council be established consisting of delegates from the regions with other persons of national standing which would advise the regional bodies. The British Hospitals Association is the only organization representative of voluntary hospitals as a whole. Admittedly it has its defects and shortcomings. It was likened by one witness to a schoolmaster without a cane endeavouring to keep order among a thousand

mischievous boys. But the Commission feels that it is the obvious body to take the initiative.

Those who recall recent hospital history will be reminded of Lord Chancellor Cave's Committee in 1921 which resulted in the setting up of a voluntary hospitals commission with local committees. It is rather an unhappy precedent for the organization failed to bring about the necessary reforms, it never secured the hearty support of the hospitals themselves, and gradually ceased to function. But much has happened during sixteen years. In 1921 the council hospital had not appeared above the horizon and there was no external menace to induce the hospitals to give up their cherished autonomy. To-day the hospitals themselves are demanding the very reforms which the Cave Committee urged upon them and which they neglected to carry out.

Already in some areas action has been taken to prevent uncontrolled hospital building and to bring about co-ordination. In Manchester an advisory board has been set up to guide public opinion and philanthropic effort *in the right direction*. In Oxford an attempt is being made to bring about a reasonable degree of co-ordination of hospital services in the Radcliffe Infirmary area and there are similar efforts in Liverpool and Sheffield.

Central and Regional Organization

What would the proposed central and regional councils do? The central council would be able to indicate the extent of each region and would put neighbouring regions in contact so that there would be no overlapping and no gaps. Eventually a complete mapping of the country into regions would be obtained, and in each region the location and character of the hospitals, their accommodation and their relationship to the distribution of the population and to the council hospitals would be clearly established. The important duties of the regional headquarters would be to receive such daily information from the hospitals as would enable them to maintain a list of empty beds, to know where patients could best be sent according to their disabilities to arrange transfers, and to avoid waiting lists. They would keep records of patients and with the patients' consent would furnish to hospitals and medical attendants relevant information therefrom. They would control an ambulance service, keep a list of blood donors, form a centre for social service co-operating with the almoner service of the hospitals and collect and supply morbidity statistics. Among their other duties would be to bring about the adoption by hospitals of joint purchasing schemes to advise on hospital building enlargement and development to analyse the finance of individual hospitals so that comparisons of expenditure could be made, and to co-operate in publicity.

The grading of all the hospitals in the region would be carried out by the regional council. Hospitals would be divided into central district, and cottage hospitals. A central hospital would make a maximum provision for investigation and treatment of patients, be staffed by consultants, have a large number of beds and be in or adjacent to a large town. A district hospital would have complete provision for dealing with ordinary maladies, its staff would consist wholly or partly of general practitioners chosen for their abilities in particular directions, it would have not less than 100 beds and be situated in or near a medium sized town. The cottage hospital would make only partial provision for patients, be staffed by all the local practitioners, have a small number of beds but not less than twenty, and be situated in a small town or country district.

Hospital Finance

The voluntary hospitals are, taken as a whole, financially solvent, with an annual maximum surplus of over one million. But, as we have pointed out more than once in discussing the hospital statistics for the year, this is the result of pooling on paper a thousand separate exchequers, some with surpluses but others with deficits, which actually are never pooled and have no more in common than banking accounts of competing firms. The Commission believes that if the thousand hospitals were able to distribute their total annual income in accordance with their individual needs their financial position would not be unsatisfactory. It recommends as a first step the creation of regional funds on a basis similar to that of King Edward's Hospital Fund for London. Such funds would have the double advantage of creating new sources of support and of educating donors to help the hospitals as a whole with the knowledge that their contributions would be directed into deserving channels.

On the subject of State subsidies the Commission pleads for a realistic view of the situation, without too much regard to precedent. The work undertaken by voluntary hospitals is of national importance, and if voluntary effort cannot find the money for it any traditional disinclination to accept money from the State should disappear. The State does in fact already contribute towards the cost of treatment of certain classes of patients, and it recognizes the responsibility of the hospitals for the education of the doctor and the nurse. All that remains to be considered is the adequacy and the method of payment.

Each of the proposed regions would be self limited as regards collection of funds. All hospitals should endeavour to arrange their collections so as not to "poach" but it would be equitable for the central hospitals to seek financial support over the large areas which they serve, although such areas include those of the smaller hospitals, while the teaching hospitals might justifiably seek benefactions even more widely.

The Commission welcomes the establishment and growth of contributory schemes and approves the income limits laid down in the Hospital Policy of the British Medical Association.

Accommodation

The Commission then goes on to consider a number of questions which might not be regarded as strictly within its terms of reference, but rather to be referred to the central council when appointed. It is generally accepted that bed accommodation should be equivalent to two beds per 1,000 of population, but there must be variations according to district. The provision of auxiliary hospitals—a better name than convalescent homes—would be an enormous relief to the general hospital, assisting a much more rapid turnover of patients. The further establishment of special hospitals devoted to particular classes of disability or special sections of the population is, generally speaking, to be deprecated as making for rigidity of accommodation. Efficient and speedy co-operation between hospital and outside nursing services is to be encouraged. Every hospital should seek the greatest possible elasticity in the allotment of its beds to various classes of patients. It would assist the problem of accommodation if specialist members of the staff of the central hospital would act as visiting consultants to smaller hospitals in the region.

The Commission regards it as the duty of voluntary hospitals to provide beds for paying patients, and, as

far as administrative arrangements permit, the patients should have free choice of medical attendant. The establishment of provident schemes for paying patients of moderate means is to be welcomed.

With regard to out patients the Commission has taken cognizance of the view expressed by the British Medical Association that attendance should be restricted to casualty cases, cases bringing a recommendation or letter from a practitioner for a consultative opinion cases which, following upon such consultation, are found to require special treatment not conveniently obtainable elsewhere, and cases of discharged in patients requiring special treatment for a further period. It agrees that ultimately it may be found possible to restrict the department in this manner, but it holds that there are persons of small financial means—dependants of lower wage earners insured under the national health insurance scheme, and some others of like status—who should be kept in view, and it might not be advisable to insist on such a restriction at present.

The Visiting Medical Staff

On the question of appointment of the visiting medical staff the Commission considers that the appointing body constituted by the board of management should be small. It is unwise to make appointments by mass meetings. Appointments should be for a term of years, but renewable, it is not to be anticipated that the appointment would normally terminate before the age limit was reached (60 is suggested), but such a provision would be a safeguard. The Commission has taken note of the report of the Linlithgow Committee on payment of medical staffs, and states that all the evidence it has heard goes to establish the principle of such payment. The principle does not apply with quite the same force to members of staffs of teaching hospitals, who have in their position a professional asset of considerable value, or to staffs of hospitals with a large number of pay beds, though the advantages of such positions are subject to some qualifications. While the general principle of payment is approved no universal application of the principle can be expected immediately, local opinion must be allowed to grow. A part-time honorarium or salary will probably be found the best method, but it must entail a statement of duties undertaken and an obligation to fulfil them more exactly than has sometimes been regarded as necessary.

On the special position of the teaching hospital the Commission considers that financial support for medical education should include adequate attention to the part which the teaching hospital plays. Such a hospital must include in its work the care of all classes of disabilities in sufficient numbers to meet students' needs. It should receive patients in the early stages of disease who might otherwise receive preliminary treatment elsewhere. Its out-patient department must cover as wide a range of maladies as possible, and retain patients in a way not necessary in other hospitals in order that they may be observed to a conclusion.

Finally the relationship between voluntary and council hospitals is glanced at. The growing realization of interdependence is welcomed, and representation of local authorities on regional councils and of the Ministry of Health on the central council is suggested. The Commission realizes that many of its recommendations are already fulfilled in greater or less degree but it desires to bring about a complete system of hospital co-operation.

CARE AND AFTER-CARE OF THE TUBERCULOUS

EMPIRE CONFERENCE IN LONDON

Under the auspices of the Overseas League and the Papworth Village Settlement an Empire Conference on the Care and After-care of the Tuberculous was held in London at Overseas House St James's during the past week. It was attended by delegates from India, Canada, South Africa and the Colonial Empire, members of the tuberculosis services in the United Kingdom, and representatives of the medical services of the Royal Navy, Army and Air Force. The first three days were devoted to discussions and later in the week Papworth and other centres of interest were visited. The Marquess of Willingdon presided over the opening session and read a message from the patron of the Conference the Duke of Kent, who referred to the movement as a "splendid gesture of co-operation between the medical services of the British Commonwealth of Nations".

Inaugural Address

SIR KINGSLEY WOOD the Minister of Health delivered an inaugural address. Until some ten or eleven years ago he said tuberculosis stood first amongst the principal epidemic or general diseases as a cause of mortality. To go further back during the period 1851-5 it was responsible for a death rate of 3,638 per million of population. Since then however the statistics had shown a continual decline, and in 1935 the standard death rate was 687 per million. At the same time he deprecated any spirit of complacency. Tuberculosis still stood next to cancer in the list of killing diseases. After discussing briefly the public measures against tuberculosis including those taken under national health insurance Sir Kingsley Wood said:

I think we can point with a measure of satisfaction to the position to-day. The material growth of schemes in England and Wales can be judged from the fact that as against 5,200 beds in 1911 there were at the end of 1935 some 29,000 in approved institutions of which approximately two-thirds were institutions belonging to local authorities who also contribute largely to the maintenance of voluntary institutions. I do not think I exaggerate the position when I say that the country is covered by a network of tuberculosis dispensaries with an attendant staff of officers and visitors working in touch with general practitioners and the medical officers of health of the local sanitary authorities.

But much ground remained yet to be covered, and the winning of it was a worthy task.

Modern Outlook on Tuberculosis

SIR ARTHUR MACNALLY Chief Medical Officer to the Ministry, who followed contrasted the pessimistic outlook of earlier times with the reasoned optimism of to-day, though there were in the dark ages of tuberculosis treatment some progressive physicians who anticipated the modern view. Robert Graves (1796-1853) familiar for his work on exophthalmic goitre was one who realized that the cure of tuberculosis was possible not only in the early stages but in stages of moderate advance with cavities. Koch's discovery of the tubercle bacillus enabled a more scientific approach to be made. Opinion gradually grew in favour of the open air method for consumptives and systematic sanatorium treatment was stimulated by the work of Brehmer at Gorbardsdorf of Walther at Nordrach of Robert Philip and Marcus Paterson in this country and by the establishment of the sanatorium at Midhurst.

The medical practitioner now treated tuberculosis with greater hope and more success. He had found in artificial pneumothorax a valuable aid in the treatment of cases in early and moderately advanced stages. More work was being done to-day in thoracic surgery. Lives were prolonged by thoracoplasty and other forms of

collapse therapy. Here a judicious selection of cases was all important. It must be remembered that pulmonary tuberculosis still revealed itself by physical signs and symptoms and that palpation percussion and auscultation were not displaced but reinforced by radiography. After glancing at the work done on surgical tuberculosis Sir Arthur MacNally concluded with the remark that tuberculosis was no longer to be relegated entirely to the physician or surgeon. Its social implications were far-reaching. It was for this reason that sanatorium benefit was embodied in national health insurance in the early days and this had led to the tuberculosis schemes of local authorities. The public had co-operated splendidly in taking advantage of the facilities provided. Voluntary and lay workers had laboured side by side with professional workers, and had seen their reward in a steady decline of the tuberculosis death rate year by year. It was said of a French marshal that he knew how to win victories but not how to make use of them. It was not enough to lessen the death rate the sociological side of the matter must receive attention, and here he extolled Papworth as an example.

The Problem in India

The first speaker from overseas was Major-General Sir CUTHBERT SPRAWSON director general of the Indian Medical Service. The steady decline in mortality from tuberculosis in Great Britain, he said, was not matched in some overseas countries of the Empire, certainly not in India. The incidence of mortality from tuberculosis in India was really not known except so far as the Army and the prison population were concerned. The Public Health Commissioner of the Government of India in his latest report estimated that there were about two million cases of tuberculosis in the country and this figure was probably below the mark. Many cases went undiagnosed and unreported. Even as it was, in the cities of Poona and Ahmedabad one out of every twelve deaths and in Cawnpore one out of every eleven, was due to tuberculosis. While the English city of Ipswich had a death rate from pulmonary tuberculosis of only 52 per 100,000 population that for Calcutta in 1934—and it was probably an under estimate—was 240. There was a general feeling, moreover, that the incidence was increasing. Twenty years ago the Government of India appointed an expert Dr Lankester, to examine the question, and he reported then that tuberculosis was on the increase and since then much industrialization had taken place. It was the general experience that industrialization especially if not well controlled and the migration of the rural population into cities, was accompanied by a higher disease rate.

Canada and South Africa

Dr R. E. WODEHOUSE Deputy Minister, Department of Pensions and National Health, Ottawa gave a brief account of the Canadian position. The death rate for tuberculosis (all forms) was 60 per 100,000 population in 1900 it was 180. This figure included the deaths among North American Indians, in whom the disease had a high prevalence. In its care schemes Canada was following American rather than British practice.

A report was to have been given by Dr B. A. DORMER representing the medical services of the Union of South Africa but in his absence through illness it was made by Dr A. D. PRINGLE the representative of the Transvaal Chamber of Mines. The tuberculosis death rate among the two million Europeans in South Africa was on the whole more favourable than in European countries but among the seven million coloured persons it was certainly alarming. The notifications of tuberculosis in 1936 were Europeans 792 non-Europeans 8,755.

Dr Pringle made his own report later on the conditions on the Rand and in the Transvaal and Natal generally among the European population. He described as connected with the mining industry four institutions for the care of the tuberculous. The first was the Springbok

Sanatorium, Johannesburg which was divided into three sections—for silicotics, for early cases of tuberculosis, and for advanced cases. The others were the South African Institute for Medical Research, the Medical Bureau of Examiners (who examined all applicants for underground work) and the Miner's Phthisis Compensation Board. A miner who had silicosis in any of its stages and developed tuberculosis as a complication was immediately put off work and received a pension, varying with his family circumstances of from £12 to £22 a month. The underground worker who suffered from pure tuberculosis received a lump sum payment of some £600 or £700, but had no legal pension. Dr Pringle gave an account of the help apart from monetary compensation, which the gold mining industry gave to tuberculous employees especially in finding them suitable employment if they could undertake it, and in looking after their children. Among miners engaged since the establishment of the Bureau of Examiners in 1916 the tuberculosis prevalence was about the same as among members of the Royal Air Force. Speaking generally, there had been a fall of some 66 per cent. in the prevalence of tuberculosis among European miners.

African Native Races

Professor S LYLE CUMMINS said that there was a more hopeful aspect of the tuberculosis problem as relative to communities of a primitive cultural type. The admittedly high susceptibility to the disease among African natives was far more marked when they were exposed not only to infection but to severe industrial stress or unfavourable environmental conditions. Under their own natural or tribal conditions of occupation, diet, housing and social life, tuberculous infection was on the whole fairly well tolerated and might even assume a more or less "European" clinical type permitting a long survival and being amenable to treatment. Thus there was scope for well-organized and scientifically planned tuberculosis schemes adapted to native custom and tradition and within the economic power of the Governments concerned. He paid a warm tribute to the voluntary efforts of Christian missions. Only those who had visited the Franschoek and the Ciskoi could appreciate sufficiently the unstinted devotion and admirable scientific accomplishment of such men as McVicar of Lovedale, Drew of the Holy Cross Mission and the missionaries and nurses at St Cuthbert's. It was to be hoped that the Government would follow the medical missionaries in adapting its developments to native customs and preferences, stressing the medical as opposed to the administrative side of the work, and saving the public purse from the unnecessary drain of marble halls for the patients, expensive accommodation for staffs and 'the beautiful perfections of sanatorium construction so dear to inspecting officers and so dreaded by the simple and illiterate natives.

He also mentioned the great sanatoriums of Nelspoort and Springkell, the former designed very much on the architectural lines of Midhurst. For these up-to-date and efficient institutions South Africa was indebted to the late John Garlick of Capetown—a man who expressed quite definitely the Papworth idea adapted to South African, and especially to native conditions—the Chamber of Mines at Johannesburg and the Union Government.

Sociological Implications

In presiding over the second session of the Conference VISCOUNT DAWSON OF PENN referred to the movement in this country towards an improved standard of physical fitness. But physical fitness was not going to be produced only by change of environment. Heredity had its application in this particular problem. If there was to be a fit race care must be taken for all people suffering from communicable disease. Care and after-care for example of an open case of tuberculosis was not only an act of mercy—or of justice—for the unfortunate individual but an act of necessity for the health of the community. The growth of knowledge on the one hand

and of social conscience on the other had led to the saving of many who in previous generations would have been removed by death. But herein lay a danger. People who were patched up were not good begetters of the next generation and the more patched up lives that were saved the greater the danger. This was an argument not for relaxing in the least the care of those who could only be patched up and not be cured but for separating the two classes. Unless that were done, the bestowal of kindness and care to-day might result in the infliction of injustice on the next generation. Papworth did recognize that demarcation between the two groups of cases and while recognizing it, cared efficiently, mercifully, and kindly for both.

Tuberculosis and City Environment

Dr S VERE PEARSON the new chairman of the Joint Tuberculosis Council, spoke on factors in city life which favoured tuberculosis. Was it realized that London was thirty miles across? Capital cities were sucking up the people from the rest of the country. The conditions of such concentration which seemed to have a bearing on the prevalence of tuberculosis were (1) the time and energy wasted in travelling to and from work, (2) the growing difficulty of obtaining open air recreation within reasonable distance (3) the anxiety associated with city environment. Yet a town healthily planned might have a low death rate. The tuberculosis death rate for Letchworth was only 38 per 100,000 as compared with 46 for Hertfordshire and 60 for Norfolk.

The same subject was dealt with by Dr F R G HEAF of the Public Health Department, London County Council. He said that the average rate of incidence of pulmonary tuberculosis for outdoor manual workers was greater than for indoor non manual workers, and quoted figures which he said, were a severe criticism of the old idea that an open air occupation was essential for the tuberculous patient. The figures also showed that the class which endured the hardest physical strain, received the lowest wages, and spent the smallest amount on food was the one most prone to tuberculosis. The vast majority of adults (assuming they did not receive a very massive dose of tubercle bacilli) would remain free from active tuberculosis even if they came into contact with infection quite often provided they were well nourished and not subject to excessive physical and mental strain.

Environmental Factors

Finally, Sir PENDRILL VARRIER JONES medical director of Papworth declared that tuberculosis must be regarded as a disease which had its roots in the social structure. To regard it from a purely medical point of view was as wrong as it would be to ignore the bacillus itself. What was it that governed susceptibility and resistance? Not merely material conditions, but a mental state. The mental state which predisposed to tuberculosis was brought about by an imbalance of the endocrine system, which somehow upset and undermined resistance to disease. The means by which this mechanism operated needed to be carefully studied and research of an intensive kind along these lines ought to be undertaken. From twenty-one years' observation at Papworth he was confident that much more than material conditions were responsible both for their well being and for their success in keeping disease in check.

The speaker complained of the persistence of a mediaeval outlook whereby diseased or disabled persons were regarded as inferior creatures. The man who had contracted tuberculosis had done nothing wrong, often he was a victim of civilization and should be compensated for the wrong done to him.

It may be asked why the medical profession should concern itself with these matters. Is the physician to be a jack of all trades with a little knowledge of medicine, a little of sociology and a little of economics? My answer must be prefaced by another question. Is it not true that unless socio-

logical and economic factors are correlated with medical treatment the tuberculosis problem is in the present state of knowledge insoluble? If the answer is in the affirmative then surely the medical profession must so concern itself. It is beyond question desirable that the physician should know something of humanity and human aspirations something of wages and hours and problems of management. If he will co-operate with his patients using and supplementing their knowledge and letting them use and supplement his he will succeed in assisting them rapidly and surely towards recovery.

Tuberculosis in Countries of the Empire

The third session of the Conference was presided over by Lord HORDER who said that the tendency to speak of tuberculosis as being under control in this country struck him as an over statement. It was true that the morbidity and mortality rates during the last two generations in Great Britain showed considerable improvement yet John Bunyan's striking description of tuberculosis as one of the

Captains of the men of death remained true. Tuberculosis still accounted for six times as many deaths as happened on the road. It was a lugubrious thought that during the twenty four hours since the Conference had opened ninety deaths had occurred in Great Britain from this disease in one form or another. In some parts of the Empire the mere diagnosis of tuberculosis struck a death knell, as it did in this country a few generations ago. In many countries the equipment necessary for carrying out treatment during the active stage of the disease and the provision for the very necessary after treatment was lacking. The virulence of the disease elsewhere was also much greater than in this country. The process of racial immunization was only beginning in some of those parts of the Empire for which they were responsible.

Dr R. J. COLLINS representing the Canadian Tuberculosis Association gave some account of Canadian conditions especially in his own province of New Brunswick. Each Canadian province had developed its tuberculosis work on its own lines. Something was done in the way of vocational training supplemented by the placing of men in sheltered employment.

The Government of Australia was represented by Dr A. J. COLLINS who detailed the public health measures put into force against tuberculosis more particularly in New South Wales. A village settlement on the principle of Papworth was in embryo. Pulmonary tuberculosis was not as serious in Australia as in many parts of Europe. The climate did not favour the disease and the cities were not congested. The death rate from pulmonary tuberculosis in New South Wales was only 35 per 100,000 of population ten years ago it was 44 and in 1875 it was 114. A good deal had been done in the way of public education. Something remained to be done in propaganda among the medical profession. It was only a small proportion that was at fault in lax notification with delay in treatment but the effectiveness of the public health measures were thereby to some extent stultified.

Fight Against Tuberculosis in Wales

Dr D. A. POWELL, principal medical officer of the Welsh National Memorial Association said that the disease continued to exact a heavy toll from the Welsh people particularly in the western and north western seaboard counties. The death rate in 1936 was 85 per 100,000. It had fallen since 1911 by 43.5 per cent. What was the cause of the high incidence? It could not be the germ. Even the most ardent nationalist had not yet isolated a Welsh strain of the bacillus. It must be the intense conservatism of social habits and the closeness and density of the family relationship. Kinship was recognized to the eighth remove in Wales. Three occupations of the country added to the liability: coal mining, quarrying and seafaring.

The later proceedings of the Conference including Sir HENRY GALVIN'S address on some problems of surgical tuberculosis will be referred to in the next issue.

DOMICILIARY MIDWIFERY SCHEME FOR LONDON

At its meeting on May 4 the London County Council was informed of the progress made with the preparation of proposals for giving effect in London to the requirements of the recent Midwives Act for the provision of a domiciliary service of midwives adequate to the needs of the county.

It is proposed to organize the services under the Act in five areas: the first comprising the eastern and north-eastern boroughs, the second the City and certain adjacent boroughs, the third the western and north western boroughs, the fourth the south-western and some of the south-eastern boroughs, and the fifth the remainder of the south-eastern area. Each area will have a complete and as far as possible self-contained domiciliary service. Hospital accommodation when required will be provided by the Council, the voluntary hospitals and the borough maternity hospitals. Domiciliary confinements and maternity nursing will be undertaken by midwives employed either directly by the Council or indirectly through voluntary hospitals and other voluntary agencies. At the same time, says the report of the Hospitals and Medical Services Committee, there will be ample scope for general practitioners and private practising midwives.

Medical aid for domiciliary cases will be provided either by the voluntary hospital concerned or by a panel of medical practitioners approved by the Council after consultation with the Metropolitan Counties Branch of the British Medical Association and large enough to give the patient a free choice of doctor. It is hoped that where voluntary hospital medical schools are concerned the opportunities for training in the neighbourhood of each hospital will as far as possible be at the disposal of medical students in preference to pupil midwives. Every care will be taken to safeguard the right of the mother to free choice of midwife.

For the purpose of calculating the amount of grant to voluntary hospitals and maternity homes the arrangement for the first year (subject to revision afterwards in the light of experience) will be on the assumption that a midwife can undertake eighty cases a year either acting alone or accompanied by a medical student or 100 if pupil midwives are associated with her and the cost of a whole-time midwife's service including cost of relief and allowance for equipment and travelling will be computed at £250 a year. The grant will be 75 per cent of the cost calculated on this basis—that is £187 10s., being equivalent to a payment of £2 6s. 10d. per case attended by a midwife either acting alone or accompanied by a medical student and £1 17s. 6d. a case if a pupil midwife is associated with the midwife. Contributions received from patients will be deducted from the Council's grant. A different procedure is followed in calculating the grant to district nursing associations (which will be concerned mainly with maternity nursing and with the provision of relief for the Council's midwives).

Number of Midwives to be Appointed

At present there are 253 independent midwives engaged in domiciliary midwifery in London. Of these fifty-one are employed by private nursing homes. Of the 63,684 births occurring in London in 1935 22,698 took place in the home and of these 8,303 or 36.6 per cent were attended by independent practising midwives 5,720 or 25.2 per cent by general practitioners and the remaining 38.2 per cent by voluntary organizations (8,303) or by borough midwives (366).

On these figures and having regard to the demand which the Council is likely to have to meet when the new service is in operation and to the tendency to resort to hospitals for confinement the Council makes the conservative estimate that after allowing for the services of

the voluntary agencies and of the midwives employed by some of the metropolitan borough councils, forty two salaried midwives will be required to be appointed by the Council for midwifery and maternity nursing. For purposes of relief the equivalent of a further six salaried midwives will be required. The salary proposed for the midwives to be employed directly by the Council is £200 a year, rising by annual increments of £12 10s to £250, and after a further period of four years, by the same annual increments to £300. Allowances of £38 will be made for uniform, laundry, telephone, and travelling expenses. The midwives equipment and sterile outfits will be provided by the Council. In making appointments preference will be given to thoroughly competent independent midwives practising in London. It is not proposed at the outset to differentiate between fully trained nurses and midwives holding only the C.M.B. certificate, or to exclude married women provided they are able to undertake full time employment.

A uniform maximum fee is to be charged for attendance by any midwife under the Council's proposals of £2 for a first confinement by a midwife and £1 10s for subsequent confinements and £1 10s for attendance of a maternity nurse. For the purposes of deciding whether any part of this fee shall in any case be remitted having regard to the circumstances of the patient or liable relatives, a uniform method of assessment has been worked out and was placed before the Council. In these rules special consideration has been given to the manner of dealing with maternity benefit, and certain concessions are made which it is thought will be reasonable and fair in the interests both of the mother and the Council. The Council has endeavoured in computing the assessable income, to ensure that family circumstances are not straitened at this period, and that good and ample nourishment is afforded during confinement.

THE NATIONAL BIRTH CONTROL ASSOCIATION MEDICAL CONFERENCE, EDINBURGH

A well attended conference on the medical aspects of contraception, organized by the National Birth Control Association, was held on April 30 in the Hall of the British Medical Association, 7, Drumsheugh Gardens, Edinburgh.

In a speech of welcome Mr DOUGLAS MILLER, chairman at the opening session, defined the aims of the association as the promotion of the physical fitness of the mother and her children by such advice and help as would result in a rational spacing of birth or in the prevention of conception in cases in which pregnancy would be detrimental to health. To this end it was necessary to collect and co ordinate the observations and experiences of research workers and clinicians so that the best possible advice might be placed at the disposal of those whom it would help. It was also essential to organize and equip voluntary clinics, of which there were now between fifty and sixty throughout the country. Mr Miller stressed the fact that clinics under the auspices of the association gave advice not only on the prevention of pregnancy but also on problems of sterility and marital maladjustments. The chief purpose of the afternoon discussion was to assess the relative value of the various methods of contraception, and in particular to distinguish those which were harmless and effective from those which were not.

Contraceptive Technique

Dr HELENA WRIGHT said that the contraceptive technique taught at birth control clinics aimed at the provision of a mechanical barrier against direct insemination and of a harmless chemical spermicide, which might be supplemented by a douche. It was necessary that the

methods adopted should be effective harmless easy to learn cheap, and acceptable to both parties. These were the standards in terms of which practitioners at the clinics and in private practice should examine the methods offered for their consideration. That the technique adopted at English and Scottish clinics was effective was shown by a statistical analysis of their results carried out in 1934. In a very large series there were 5 per cent. of "accountable" failures—namely, failures explicable by an omission to carry out the whole or part of the instruction given at the clinic—and from 1 per cent to 2 per cent unaccountable failures—namely those for which no such cause could be found. The main difficulty in making statistical studies was that a large proportion of patients did not return to the clinics for re-examination after being taught the methods. In this respect, however, matters were improving. For instance, several years ago at the North Kensington clinic 60 per cent of the patients failed to return after their first visit, two to three years ago the proportion had fallen to 40 per cent, and recently to only 10 per cent. In Dr Wright's view the most important lines of investigation were concerned with the vulnerability and resistance of spermatozoa and the discovery of highly effective, clinically acceptable spermicidal substances. On the psychological aspect it was more difficult to generalize, but it could be stated that no method would be used continuously which was a source of annoyance to either partner.

In the discussion that followed questions were asked on whether methods of contraception were modified in cases of cervical erosion and leucorrhoea, the teaching of patients before marriage, the safe period as a method of contraception, the possible damage to the foetus from a chemical should conception occur, the possible clinical application of the Ogino Knaus method, sterilization as a means of contraception, including x ray sterilization, and whether a speculum examination was necessary before giving advice.

Chemical Contraception

At the second session Professor F A E CREW, director of the Institute of Animal Genetics, Edinburgh introduced Dr JOHN R BAKER, lecturer in cytology, and referred to the interesting scientific work he was doing at Oxford.

Dr Baker describing the work on chemical contraception which had been carried out under a grant from the Birth Control Investigation Committee by himself and his co-workers in the Sir William Dunn School of Pathology, Oxford opened with a plea for a more logical terminology in chemical contraception proposing that solid products should be called gel (jelly), fatty, or tablet suppositories, while the terms paste, 'mucilage, and 'ointment' should be used for semi fluid products. The name jelly had been applied loosely to thick, aqueous products properly designated as pastes. In view of the great complication of modern contraceptive methods there were he held considerable advantages in the simplicity of gel suppositories containing strong spermicides already in solution and ready for immediate action. The idea that contraceptives must be acid was rejected. Dr Baker described his laboratory tests of chemical contraceptives, which were concerned with rate of disintegration acidity or alkalinity, total spermicidal power in alkaline solution, total spermicidal power in acid solution, rate of diffusion of the spermicide from the vehicle, and harmless ness. In the tests of total spermicidal power proprietary products were tried at the standard concentration (S) of one product to 6 c cm of sperm suspension, it being postulated that about 6 c cm of fluid were usually present in the vagina after coitus. The spermatozoa were examined at five and thirty minutes and again after dilution with an alkaline fluid favourable to their activity. The dilution revealed whether the sperms had been killed or only immobilized.

A product which killed at S was tried at S/2 S/4 etc. It was thought that a factor of safety of at least four

was necessary—that is, a product must kill all sperms at S/4. In the diffusion test an attempt was made to represent natural conditions as closely as possible. Observations of the activity of the sperms were made at 2, 5, 15, 30, 60, 120, and 180 minutes. In the case of many products on the market the sperms were still active even after 180 minutes. The pathological test was performed on bitches because of the resemblance of the vaginal epithelium to that of the human female. The bitch's vagina was larger than the human in proportion to body size and therefore half a suppository was the dose. This was inserted daily for a fortnight when the bitch was killed and the vagina was sectioned for critical examination by Dr Carleton. Gross damage by certain products in use by women was demonstrated. It was recommended that clinical workers should use the following formula for estimating pregnancy rates when comparing one contraceptive with another $\frac{100P}{M-A-P}$, where P was the number of pregnancies, M the number of menstruations, and A the number of whole menstrual cycles during which the husband was absent from his wife. The formula was similar to Raymond Pearl's. Dr Baker ended by saying that he was hopeful that his researches would soon disclose a valuable new spermicide, but that he had often been disappointed when he had seemed on the verge of success. He also paid a special tribute to the medical subcommittee of the National Birth Control Association whose co-operation had resulted in improvements in the methods used in his laboratory.

In the discussion which followed great stress was laid on the importance of collecting a group of persons ready to collaborate in the first application to human conditions of any new chemical method. Such persons being so few at present progress would be necessarily slow. One result of the conference might be to increase the number of volunteers. During the conference the Edinburgh Mothers Welfare Clinic at 90 East Crosscauseway and the Museum of Contraception under the direction of Professor Lelean in the Usher Institute of Public Health were open for inspection and many members of the conference availed themselves of the opportunities thus offered.

Reports of Societies

ACCLIMATIZATION TO HIGH ALTITUDES

At a meeting of the Royal Society on April 29 a paper by Messrs A. Keys, B. H. C. Matthews, W. H. Forbes, R. A. McFarland, and D. B. Dill on individual variations in ability to acclimatize to high altitudes was communicated by Sir Joseph BARCROFT.

The International High Altitude Expedition made observations at sea level, 9000, 12000, 16000, and 20000 feet of the physiological constitution of ten normal subjects, and the authors had now attempted to correlate these observations with acclimatization. The capability of acclimatization of the members of the party was graded by a questionnaire to which all gave answers as to the deviation in physical and mental performance from their sea level values of all members of the party. By this classification the members of the party were arranged in order at each altitude. A number of physiological properties were observed at sea level and at each station. No one of these yielded a good correlation with the classification referred to above, but the whole series taken together with suitable empirical coefficients yielded a good correlation with the acclimatization classification—so much so as to encourage the belief that it would thus be possible to predict from sea level measurements whether an individual would acclimatize well or badly.

THE BLOOD GROUPS AND NON-PATERNITY

At a meeting of the Medico Legal Society on April 22 with Mr C. ANSWORTH MITCHELL, the president in the chair, Dr G. ROCHE LYNCH read a paper on the medico-legal importance of the blood groups, with special reference to non paternity.

Dr Lynch was, he said, reporting on the progress made since he had last spoken on this subject in 1924. The existence of M and N agglutinogens in corpuscles was now established, making three more blood groups in addition to the older A, B, AB, and O groups. These groups were M, N, and MN, there was no group corresponding with O. A combination of the two sets gave twelve possible types of human blood. The agglutinogens were found in other body fluids—such as sweat, saliva, semen, and milk—in certain individuals. Their presence in these fluids apart from the blood was an hereditary factor. The agglutinin factors (a and b) were not found in these fluids. The uses of these blood groups were in transfusion work, in the identification of blood stains and of seminal stains, and in attribution of paternity and determination, very rarely, of non maternity and child substitution. The factors followed strict Mendelian laws of heredity and to be present in a child must be present in a parent. Apparent exceptions had now all been explained. The test to day was as sure as the fingerprint test if not surer.

Dr D. HARLEY summarized the rules of inheritance governing the blood groups. A group O parent could not have a group AB child, and vice versa, and no factor could appear unless it was present in the blood of one or other parent. A type M parent could not have a type N child and vice versa. These rules had been amply confirmed by study of very large groups of families over several generations. They were therefore applicable to false accusations of paternity. If, for instance, a group O woman had a group B child and accused a group A man of paternity, his innocence could be absolutely established. Any man of group B or group AB, however, might have been the father. The groups could never prove that a certain man was the father unless there were a choice between two possible fathers. A BM woman had an AM child, her husband was AM and her lover AN, it was thus shown that the husband was the father. The chance of proving non paternity varied with the group of the accused man and its frequency in the population from 65 per cent to 8 per cent. On an average one falsely accused man in three could be cleared. The use of these tests had gone far beyond the experimental stage.

Mr D. HARCOURT KITCHIN, barrister at law, dealing with the legal and practical application of the test said that he saw no reason why a petition for divorce should not succeed purely on the ground that the blood group test showed that a given child born in wedlock could not be the child of the husband. It was unlawful for a husband to give evidence that he had not had access to his wife and therefore could not have begotten the child, but evidence based on the blood group test would not infringe this rule. Turning to the more important subject of affiliation suits Mr Kitchin said that a single woman who had a child could apply to the court to make an order against the putative father and that if she proved her case and produced satisfactory corroboration and the man could not refute her evidence a bench of magistrates might order him to pay up to a pound a week until the child was 16. The present difficulties in the way of using blood group evidence were great. First its possibilities were unknown and the bench might be so suspicious as practically to decline to accept it. An appeal from their refusal would lie to quarter sessions and thence to the Divisional Court, but would be expensive. If they were open minded the next difficulty would be to induce the mother to co-operate for she could gain nothing at all by the test and the bench could not order her to undergo it or refuse her application for an order merely because she would

not undergo it. If she consented, the third difficulty would be to find some pathologist capable of carrying out the test. Most general hospitals could manage the AB test but the MN test required special knowledge and facilities. At present the expense was beyond the means of the kind of man who was usually defendant to a bastardy application. The fourth difficulty was that, if the test acquitted the man he would have to pay the pathologist to come and give evidence, for the written report alone was not enough. The fifth difficulty was that if the report did not exonerate the man the bench might run away with the idea that the result showed that he was the father. This danger had probably done more than anything to deter counsel and solicitors from trying to use the test. If the test was to come into general use, as it had in Germany and other countries, it must first become known to solicitors and the public. This might happen if some interesting acquittal attracted the attention of the lay Press. So far the test had never been conclusive against paternity. When the stage of legislation was reached the Bill ought to provide that (1) the magistrate should have discretion to make the co-operation of the mother a condition of her application being heard (2) the result of the test should only be evidence if it were conclusive against paternity, (3) the certificate should of itself be evidence without the necessity of calling the pathologist as a witness, (4) the test should be done at the public charge.

The PRESIDENT said that the papers had done much to make counsel for the defendant realize that he ran no risk in accepting the test if offered. Sir ALEXANDER MAXWELL did not think there was much miscarriage of justice though magistrates had an extremely difficult task. If magistrates could be induced to respect the test something might be done. The subject required investigation and attention.

Sir TRAVERS HUMPHREYS thought the subject important, but from the practical point of view the difficulty about scientific evidence was that it was not conclusive. He protested against the suggestion that the courts set their faces against scientific evidence. If it were once established that this test would further the cause of justice it would be welcomed by the whole profession of the law. Mr KITCHIN had put his finger on the point in saying that to establish the test there must be legislation to compel the co-operation of the mother. There should, however, be no real difficulty about this when its importance was established. Expense was a difficulty in getting any evidence. Assuming the test to be infallible, and no conflict of expert evidence possible the difficulty arose that the evidence could only be called on behalf of the defendant. The test might be extremely useful in divorce cases very commonly a working-class man petitioner based his case on the birth of a child which could not be his, but he was not allowed to give evidence to this effect. Nothing could be more useful to such a man than a High Court order for a blood test of all three. Sir Travers hoped that in time the courts would be given power to compel this evidence.

Sir ERNEST GRAHAM LITTLE thought the reluctance of the legal profession to accept scientific evidence was a real difficulty. The demand for legislation must come from the medical profession. Rather more respect was paid to private Bills nowadays than in the past. Sir WILLIAM WILCOX thought there was little difficulty in getting new scientific evidence before the courts. In a recent food poisoning case a plaintiff had succeeded on the strength of a positive agglutination of 1 in 60 which had been recorded on one occasion. The judge had taken the greatest interest in the evidence, no legislation had been needed. Many pathologists would be pleased to do the blood tests for moderate fees.

Judge EARENGEY K.C., said that the legal profession welcomed medical evidence when that evidence was substantiated. The medical profession must come to agree about these tests, and the technique must be

standardized beyond question before a certificate was accepted as evidence. Discovery was never extended to any personal operation, legislation, however, might be secured to say that if a woman refused the test there should be a stay of proceedings.

In reply Dr ROCHE LYNCH said that mistakes had in the past been due to a weak A factor in some subjects but never to the interference of the M and N with the A and B factors. He would never object to a provision obliging the pathologist to give evidence if either of the parties wanted it. Dr HARLEY stressed the invariability of the rules of heredity and the fact that the tests were used in many foreign countries to check the evidence of applicants. Mr KITCHIN hoped that the Home Office, if it were good enough to circulate magistrates would ask them to encourage defendants to use the test and applicants to submit to it. He had never suggested that judges of the High Court were not receptive of scientific evidence, merely that as a class magistrates and solicitors disliked it.

HYPNOSIS, SUGGESTIBILITY, AND PROGRESSIVE RELAXATION

At a meeting of the British Psychological Society on April 29, Dr WILLIAM BROWN, Wilde Reader in Mental Philosophy, University of Oxford, gave an address on hypnosis, suggestibility, and progressive relaxation.

After tracing the history of the subject since the days of Mesmer and describing some experimental work, Dr Brown said that it might be supposed that it included a good deal of questionable matter but he wished to emphasize the clinical and therapeutic side, where it had large constructive possibilities. Hypnosis with suggestion could bring about a state of progressive relaxation more rapidly than the same state could be achieved in any other way. The patient, too, could in time produce relaxation by autosuggestion. Relaxation began with the muscles of the extremities, included the muscles of the back of the neck, and affected eventually the involuntary musculature. The autonomic nervous system was influenced and deep relaxation produced. This relaxation, although it started with the motor muscles, was not confined to them. The state might be used to give suggestions of greater ability in various directions. Customarily the will was regarded as controlling only the voluntary muscles, but by the stimulus of processes which obviously were under the control of the will other processes not so obviously under control were affected.

Dr Brown referred to some recent work in which an experimenter, after calling out to the subject "Contract," had flashed a bright light into the subject's eye, and, of course, as a result of the light stimulus, the pupil contracted. This was repeated a number of times and a conditioned reflex was built up, so that when later he said "Contract" but did not flash the light, the pupil never theless contracted. Finally instead of himself saying "Contract" he got the subject to say it and the pupil still contracted, a conditioned reflex having been built up through the motor mechanism of speech. On the basis of clinical evidence of cases he had treated for many years Dr Brown believed that under suggestion treatment with the patient relaxed and passive, it was possible to build up a conditioned reflex. Some scepticism had been expressed as to whether a conditioned reflex could be built up in a hypnotized person but work in America had shown that it could be built up more quickly and thoroughly under hypnosis than in a normal state. Every person normal or abnormal was probably hypnotizable to a certain extent but those who were most easily hypnotized and to the most profound degree even that of artificial somnambulism, had a tendency towards the development of psychoneurosis of a hysterical nature. Dr Brown strongly emphasized that in therapeutic hypnosis only positive

suggestions should be given, not suggestions of inability to perform certain acts but the contrary. He had found the method useful in raising normal powers to a higher level—for example, increasing the power of memory not momentarily but permanently no doubt as the result of removing fears and conflicts which acted as inhibitions and reinforcing the imagination of success which was of so great importance in psychotherapy. He mentioned a composer who, fearing that he had lost his powers experienced definite benefit—of which the composer himself, who could be the only judge, had no doubt at all—after four occasions on which suggestion treatment with progressive relaxation was tried.

In reply to a question at the close of his lecture Dr Brown said that suggestion might help to restore proper function of the digestive processes if at first it were combined with some medicinal remedy. The patient might be encouraged to imagine an increasingly vigorous peristaltic movement of the intestines and the suggestion might be continued and be effective while the medicinal agent was reduced in amount and presently withheld.

DISTENSION OF THE FOETAL BLADDER

At a meeting of the North of England Obstetrical and Gynaecological Society in Sheffield on April 2 Dr F J BURKE (Liverpool) opened a discussion on dystocia due to over-distension of the foetal bladder by reporting a case.

A multipara aged 29 was admitted to hospital with dystocia. Labour began at 9 p.m. on January 27 the patient being then about thirty-five weeks pregnant. At midnight the head and hands of the foetus were born but there was no further progress. When she entered hospital she was having strong pains and was acutely distressed. The fundus reached midway to the umbilicus and the ensiform cartilage and no foetal heart could be heard. A foetal head and two hands were protruding through the vulva. The foetal neck was long and the cervical spine was fractured due possibly to previous vigorous traction. The thorax was tightly plugged in the maternal pelvis. On incising the foetal chest wall a large quantity of fluid escaped and delivery was soon completed. The foetus weighed 6 lb. It was considerably elongated with the abdominal wall in large folds and there was bilateral talipes equinovarus. At necropsy the bladder in its collapsed condition measured 6 by 4 inches and had hypertrophied walls. Both ureters were dilated and the kidneys enlarged. The urethra was patent a small catheter passing without difficulty.

Dr Burke said that several similar cases of over-distension of the foetal bladder with patency of the urethra had been described and he quoted cases reported by Savage and by Crawford and Jellcoat. He discussed the part played by the foetal kidneys in the production of liquor amnii. Gaylor Bates had pointed out the frequent association of oligohydramnios and foetal renal anomalies. The biochemical studies of Makepeace, Smith and Carroll strongly suggested that the amniotic fluid was a transudate which in early pregnancy was in isometric equilibrium with maternal and foetal blood in late pregnancy it became hypotonic owing to the addition of foetal urine. On the other hand there was evidence to suggest that the foetal kidneys did not contribute to the liquor amnii. Philoridin injected into the mother could be readily detected in the foetal tissues but it was rare to find even a trace of sugar in the liquor amnii.

The President said that the condition seemed always to be associated with obstruction to the urethra. He supposed it was more common in the male foetus. Mr J I STACY (Sheffield) thought that a striking point was the elongation of the cervical vertebrae and talipes equinovarus. He raised the question whether the condition was associated with any spinal lesion. Dr Burke replied that he had no doubt that the elongation of the cervical vertebrae was produced by trauma.

Intestinal Obstruction Caused by Adenomyoma

Mr A GOUGH (Leeds) opened a discussion on adenomyoma as a cause of acute intestinal obstruction, and reported a case.

A woman aged 42 had never been pregnant. She had had gradually increasing constipation for six months culminating in complete obstruction. The day before Mr Gough saw her she had absolute constipation as regards both faeces and flatus and had vomited once. Her general condition was quite good. There was a tense rounded swelling in the hypogastrium the size of a four months pregnancy. Vaginal and rectal examination disclosed the presence of a hard fixed mass behind the uterus and involving the upper part of the rectum. On opening the abdomen the rounded swelling was found to be a chocolate cyst of the left ovary. There was much indurated tissue involving the cervix and the upper part of the rectum. A diagnosis of adenomyoma was made and was later confirmed by histological examination. A colostomy was performed after the bulk of the morbid tissue had been removed including both ovaries and the uterus. A fortnight later Mr Gough was able to start canalization of the obstructed bowel by passing gum-elastic bougies up the rectum. These were followed later by rectal tubes passed from the colostomy opening downwards. In a fortnight the passage had been dilated to three quarters of an inch. The colostomy orifice was closed in stages by the use of an enterotome. Six days later the bowel was dissected from the abdominal wall and the wound was closed. Some leakage occurred but within three weeks the faecal fistula had disappeared. Mr Gough said that an acute obstruction due to an adenomyoma must be very rare indeed.

The President said that it was quite clear that the adenomyoma was in the bowel wall and not merely in the recto-vaginal space. Professor LEYLAND ROBINSON (Liverpool) thought that the case showed how important it was that a gynaecologist should have a knowledge of general surgery.

VARICOSE VEINS IN PREGNANCY

A meeting of the Section of Obstetrics of the Royal Academy of Medicine in Ireland was held in the Royal College of Physicians on April 9 with Dr T M HEALY in the absence of the President, in the chair. Dr EDWARD SOLOMONS read a paper on the treatment of varicose veins in pregnancy.

Dr Solomons said that sixty patients were selected from the ante-natal department of the Rotunda Hospital for treatment of varicose veins by injection. The condition was found to be bilateral in thirty-eight and unilateral in twenty-two while of the total number four cases had associated vulval varicosities. A careful history was first taken, particular attention being paid to the nature of the previous confinements. A history of phlegmasia was a definite contraindication to treatment, and in all cases of suspected impairment of the deep circulation investigation was made. The Trendelenburg test was not carried out but the simpler Perthes test was used in cases of suspected deep thrombosis. The veins were examined in a good light with the patient standing. The patient was then made to lie down with the leg slightly elevated, thus the empty vein technique was employed in all cases but without a tourniquet as only clearly visible veins were injected. The skin was painted with 2 per cent tincture of iodine and a sterile solution of quinine hydrochloride 0.266 gramme, and urethane 0.133 gramme to each 2 c.cm. of distilled water was then injected from a 2-c.cm. Record syringe with a fine needle (No. 17) the maximum amount each time being 2 c.cm., usually given in four divided doses at different sites. On withdrawal of the needle pressure was applied to the point of injection for a few minutes and then a small collodion dressing was put on before the patient walked home. Fifteen patients whose veins were very large had an elastoplast bandage applied to the whole leg below the knee immediately after injection. The bandage was removed in three weeks.

time and in seven patients no further treatment was required. In the other eight further injections were given and the elastoplast bandage reapplied for the same length of time. All injections were given at weekly intervals and were never given near the sites of the previous injections for at least two weeks. The usual technique advocated is to begin the injections near the foot and gradually work upwards, in these cases, however, the most enlarged veins were injected first.

Results of Injection Treatment

The results were very satisfactory, but not all patients were entirely free from some subsequent discomfort, though the relief obtained from their previous symptoms more than compensated them in all but two cases. Examination of the legs after injection showed that in seven there was a slight inflammatory reaction at the site of injection but no treatment was required and the ordinary daily life of the patient was in no way interfered with. In six patients the reaction was so marked as to necessitate treatment, and it was in this group of six that two patients would have preferred to remain untreated. Three of the six were told to rest in bed, and glycerin and ichthammol was applied. The other three had elastoplast bandages and were told to lead their ordinary daily life.

Four cases of varicose veins of the vulva were treated by injection with very satisfactory results, and in two dramatic relief was obtained from a nearly intolerable pruritus. It was only possible to follow up forty-five out of the sixty patients. No complications occurred in the puerperium, and three had subsequent confinements without recurrence of the condition.

General Discussion

Dr T M HEALY asked why the treatment was stopped in the seventh month and if there was any reason, obstetrical or surgical, why the treatment should not be adopted in the last two months of pregnancy. Dr A H DAVIDSON, the Master of the Rotunda Hospital, said that the method of treatment described by Dr Solomons for the treatment of varicose veins in pregnancy seemed to be a great advance. He asked if only quinine and urethane had been used and said he understood that if the vein was missed when urethane was injected that it gave rise to a lot of pain. He asked if Dr Solomons had had any experience of sodium morrhuate, and if it was better than, or as good as quinine and urethane. Dr O DONEL BROWNE, Dr F DOYLE, Dr G TIERNEY, Dr J S QUIN and Dr R M CORBET also took part in the discussion.

Dr SOLOMONS in replying said that if he saw a case in the eighth month which he thought could be cured by injections in a fortnight's time then he gave a course but otherwise he only treated patients up to the sixth or seventh month. One of the most severe reactions he had seen was in a case in which he had used sodium morrhuate. Varicose veins of the vulva seemed to respond extraordinarily well to the injection treatment. In patients who had very large veins especially near term, it was foolish to carry out injection treatment, the treatment then was by an elastoplast bandage. When in any doubt as to whether one was in the vein or not, it was much better to withdraw the needle and to try somewhere else. He only treated patients who were pregnant; patients who had varicose veins and were not pregnant should be sent to a surgeon for treatment.

Pregnancy in Diabetics

Dr H. V. TIGHE read notes on three pregnancies in a diabetic. The patient came under his care in January 1935. She was then aged 27, had been married for fifteen months and was pregnant for the first time. She had been under treatment for diabetes mellitus during the previous four years. Two months before becoming preg-

nant she had been admitted to hospital in diabetic coma. She was receiving 75 units of insulin daily and despite this her urine was rarely sugar free, while her blood sugar remained high. In April 1935, when thirty-two weeks pregnant, she went into labour. The baby weighing 4 lb, lived for thirty minutes. Five months later she became pregnant again and at thirty-two weeks gave birth to a baby weighing 5 lb which died shortly after delivery. The third pregnancy began two months later, and with a more stringent diet and larger doses of insulin proceeded to thirty-seven weeks, when labour was induced. This last baby when born weighed 8½ lb and appeared healthy, but died forty-eight hours after birth. At necropsy the cause of death was found to be supra-renal apoplexy.

Dr Tighe pointed out that insulin has affected the fertility of diabetic patients, and suggested that a definite balance between the pancreatic and other endocrine secretions was necessary to maintain the normal menstrual cycle. There was nothing observed in his case to support the view that the diabetic mother benefits from an additional supply of insulin from the foetus or that pregnancy produces a lasting exacerbation of the diabetes. While insulin has greatly lowered the maternal mortality, it has not proved so effective in reducing the foetal mortality. The causes of foetal death are poor control of the maternal disease during the later months, hydramnios, congenital abnormalities and over-development of the foetus. Neo-natal hypoglycaemia following hypertrophy of the islands of Langerhans has also been suggested as a cause of foetal death, but there was no enlargement of the islands found in the third baby at necropsy. Dr Tighe considered induction of labour a better method than Caesarean section for dealing with dystocia due to the size of the babies. In conclusion he stressed the need of keeping the pregnant diabetic under constant supervision and the necessity of close co-operation between the obstetrician and the physician.

Discussion

Dr O DONEL BROWNE said that Dr Tighe's case illustrated several points common to pregnancy complicated by true diabetes. First the labours were premature and in each of the three pregnancies some degree of hydramnios had been present. Secondly, all three children had died. Thirdly, the children (as is usual) had been overweight and it was therefore fortunate that the labours had been premature. Dr J S QUIN did not agree that there was no objection to a diabetic patient becoming pregnant. Dr R H MICKS referred to two diabetic cases which had been under his care and in which labour had been induced. Both babies had been strong and over the usual weight at birth, and the mothers had done very well.

Dr TIGHE in reply said that diabetes should be treated as a thing quite apart from an associated pregnancy and the pregnancy should be allowed to proceed normally. Satisfactory results would only be achieved if there was close co-operation between physician, biochemist and obstetrician. As the children of diabetic women were not likely to be diabetic, there could be no question of sterilization of diabetics on eugenic grounds.

The fifth International Congress of Radiology will take place in Chicago from September 13 to 17 under the presidency of Dr Arthur C Christie of Washington. Mr C Thurstan Holland of Liverpool is a member of the executive committee and among the chairmen of delegates for national groups are Dr Russell Reynolds of London and Dr R M Beath of Belfast. The unity of medicine is the main congress theme and the integral place of radiology in diagnosis and treatment will be emphasized. More than 250 scientific papers will be relating to the medical and scientific development of x rays and radium.

Treloar Cripples' Hospital, Alton

On April 29 the trustees of the Lord Mayor Treloar Cripples Hospital and College entertained members of the honorary medical board at dinner in Barbers Hall, Monkwell Street. Colonel the Hon. Frederick Lawson was in the chair, he had beside him Alderman Sir Charles Batho, Mr. O. L. Addison (chairman of the medical board), Mr. Maurice Hovenden (Master of the Barbers Company), Sir Frederick Menzies, Mr. T. J. Harrowing and Miss Florence Treloar. Colonel Lawson expressed his pleasure and that of his co-trustees in entertaining the medical board, after an interval of eight years, in this City hall with its ancient associations with surgery. He recalled that a great Lord Mayor of London, Sir William Treloar, was the founder and inspiration of the hospital at Alton, and that other civic dignitaries took part at its birth and had given help since. Under the enthusiastic guidance of the medical superintendent, Sir Henry Gauvain, the trustees had now adopted the widest definition of the word 'cripple'. Mr. Addison, in his reply to the toast, spoke of the growth of the orthopaedic department during the past ten years and the change in the type of cases now treated. Surgical tuberculosis had become a disappearing disease, he said largely due to the pioneer work at Alton, hence the enlargement of the scope of the hospital and college. Treloar, with Coram and Barnardo, would go down to posterity as three great benefactors of children. The toast of 'The Corporation and the City of London' was submitted in happy terms by Sir Henry Gauvain who paid warm tributes to his colleagues and Sir Charles Batho in reply spoke of the pleasure it had given him when Lord Mayor to help forward the work begun by William Treloar. Sir Charles Gordon Watson, proposing the health of the Worshipful Company of Barbers, said that it was a privilege to do so in that beautiful and ancient hall, whose possessions made him almost regret the severance of the surgeons and the barbers in 1745, for 400 years the barber surgeons were the foster mother of our craft. The Master in his acknowledgment showed the cup given to the Company by Henry VIII and other pieces of priceless plate.

The Tuberculosis Association in Manchester

The annual provincial meeting of the Tuberculosis Association will be held in the Central Library, Manchester, on Thursday, Friday and Saturday June 10, 11, and 12, under the presidency of Dr. S. Roodhouse Glove. The provisional programme is as follows: June 10 (joint meeting with the North Western Tuberculosis Society) 2.15 p.m., papers on 'How Long Should Collapse Therapy be Delayed?' by Dr. Geoffrey Marshall and Mr. H. Morrison Davies. 5 p.m. paper on 'Bronchiectasis in Pulmonary Tuberculosis' by Mr. J. E. H. Roberts on 'Pleural Effusions after Thoracoplasty' by Dr. O. M. Alistair. 6.20 p.m., annual meeting. June 11 9.45 a.m. papers on 'Reflections on the Treatment of Unilateral Pulmonary Tuberculosis' by Dr. P. J. L. De Bloeme and on 'My Chief Difficulties in Dealing with the Tuberculosis Problem' by Professor A. Ramsbottom (consulting physician). Dr. W. F. Jackson (general practitioner). Dr. A. Dove Cernae (medical superintendent of a mental hospital). Dr. R. E. Lane (medical officer to a large factory) and Dr. D. P. Sutherland (tuberculosis officer). 2.15 p.m. visit to Manchester Sanatorium Baguley. 7 p.m., President's reception and annual dinner at Midland Hotel. June 12 10 a.m., papers by Dr. J. B. McDougall on 'The Use of the Tomograph', by Dr. C. D. S.

Agassiz on 'Artificial Pneumothorax in Children' 12 noon problem cases presented by Dr. E. H. A. Pask and Dr. G. Jessel. In the afternoon members will be welcome at the Liverpool Sanatorium Crossley Sanatorium Barrowmore Hall Colony Abergele Sanatorium and the Manchester Tuberculosis Office and Clinic 352 Oxford Road, which will be open to members throughout the conference from 10 a.m. to 4 p.m. daily. Members of the North Western Tuberculosis Society and their friends will be welcome at all the meetings, the annual dinner and the excursions. Full information may be obtained from the honorary secretary, Tuberculosis Association, 26, Portland Place, London, W.1.

Coroners' Inquests in London

During 1936 the number of deaths reported to London coroners was 8,748 as compared with 8,209 in 1935. Of these deaths 3,343 occurred in mental hospitals and other institutions. Inquests were held in 3,180 cases as against 3,239 in the previous year. The total number of suicides was 583. Three suicides were under 17 years of age and 171 were over 60. Deaths from want of attention at birth decreased from forty-two to twenty-five. The number of people who met their deaths by accident was 1,622 as against 1,766 the previous year. Thirty-six deaths resulted from injuries and forty-eight from drowning. A verdict of Death from natural causes was returned in 568 cases and there were eight verdicts of Cause of death unknown. In nine cases a verdict of murder was returned and in one case a verdict of manslaughter. Three inquests were held in connexion with executions. Inquests on newly born children decreased from fifty-five to forty-seven. Three verdicts of murder of newly born children were recorded. Sixty-six deaths were attributed to excessive drinking. The coroner directed post mortem examinations to be made in 2,578 cases or 81 per cent. of the inquest cases and in 3,413 or 61.3 per cent. of the remaining cases in which it was decided that no public inquiry was necessary.

SCOTLAND

Hospital Treatment of Infectious Disease

In his annual report for the year 1936 Dr. C. Barelay Reekie, medical officer of health for the burgh of Dunfermline, urges the importance of wide floor space in hospitals for the treatment of infectious disease. With regard to scarlet fever he says that apart from the natural decline in the severity of this disease which some authorities had attributed to the segregation in hospitals over a number of years of the more severe cases and the introduction of scarlet fever antitoxin the diminution of complications had been largely due to improved ward environment. Overcrowding of wards instead of being economical resulted in an increased number of septic infections with protracted stay in hospital. The number of scarlet fever cases treated in the West Fife Infectious Diseases Hospital at Dunfermline had been 202 during the past year, a decrease of 360 cases on those of the previous year. Discussing diphtheria the report states that there is a tendency to send cases earlier to hospital. In the analysis of fatal cases of diphtheria it had been found that the shortest period any patient had been ill before coming into hospital was three days and this illustrated the serious effect of delaying the giving of antitoxin and the provision of skilled nursing. The number of cases of diphtheria admitted to this hospital had been 182, a decrease of 83 on those of the previous year. There was an increasing demand for the admission of cases of measles. It was not generally recognized that measles had a high mortality between the ages of 6 months and 1 year, so that the

problem of measles was not so much prevention of the occurrence of the disease as its postponement to the later years of childhood

Simpson Memorial Maternity Hospital

At the annual meeting of the Edinburgh Royal Maternity and Simpson Memorial Hospital the hope was expressed that the Royal Infirmary of Edinburgh would be able to take over the hospital, which is now approaching completion in the Infirmary grounds by November, 1938. It had been necessary to transfer £3,520 from the reserve fund to meet working expenses but receipts from legacies had showed a satisfactory improvement from £3,400 to £8,276. A subscription income of at least £4,500 was required for the hospital until the time when it could be taken over by the Infirmary. Reference was made to the fact that the municipal authorities had insisted that the new building should be constructed of natural instead of synthetic stone as had been intended, and this had involved an added expenditure of £7,000 which, it was suggested, the Corporation should provide. The number of cases treated last year had been 3,393 and there had been 10,883 attendances at the ante natal clinics of which 2,358 were of new cases.

Correspondence

High Hyoscine Dosage in Chronic Encephalitis

SIR,—Sir Arthur Hall's paper in the *British Medical Journal* of April 17, on 'The Results of High Atropine Dosage in Chronic Epidemic Encephalitis,' records that the highest dose of atropine given was 54 mg daily. The following describes briefly a case in which we have used nearly four times this dose (up to 195 mg daily) to secure symptomatic relief from oculogyric crises.

Miss X, aged 28, had an acute attack of encephalitis regarded as "influenza" in 1924. In October 1928 advanced Parkinsonism was present with the tremor and rigidity more marked on the right side. She could not walk without help and had to be assisted with changing her clothes and in eating there was no gross mental change. Oculogyric crises were however her most distressing complaint. She was given a course of tryparsamide injections and genoscolamine pills. Considerable improvement followed. In August 1933 she was taking, in addition to six genoscolamine pills daily, a mixture containing tinctura belladonnae 15 minims and tinctura stramonii 15 minims twice daily; the latter was gradually increased until 1 drachm was given in each dose of her mixture and this was continued until September 1936 when oculogyric crises were so severe and distressing that hypodermic injections of hyoscine were commenced at first in small doses (3 to 5 mg.). The dose was gradually increased until in December 1936 she had 1 grain (65 mg.) and occasionally 1½ grains (97 mg.) morning and night (that is a total of 130 to 195 mg. daily). Any reduction of the dose below half a grain morning and night caused a return of intensely distressing oculogyric crises and even with the larger doses mild attacks still occur morning and evening. Dryness of the mouth has never been a troublesome feature during the administration of these large doses, nor have any gastro intestinal urinary or mental symptoms appeared. Mydriasis is controlled by instilling two drops of a 1 per cent. solution of eserine into the eyes morning and night.

We have been unable to find any recorded case in which comparable doses of hyoscine have been given therapeutically over prolonged periods.—We are, etc.,

Blood Transfusion in Obstetrics

SIR—May I make brief comment upon two or three points arising out of Dr Malcolm D Black's paper in the *Journal* of May 1 (p 903). Dr Black states that if blood will be available within half an hour to one hour, or if the patient be at the point of death [as a result of haemorrhage] it is better to start giving an intravenous saline injection and to continue it until blood has been secured. Patients have died within half an hour of admission. An intravenous saline injection can be started within ten minutes of admission and blood transfusion could be started in the same time if blood were kept in storage.

I maintain that an immediate intravenous infusion is essential without waiting for the patient to be 'at the point of death' whenever the systolic blood pressure falls to 80 mm Hg or fails to rise above 90 mm Hg after routine nursing measures have been taken. Crystalloidal saline solution is not very satisfactory for this purpose, and when whole blood is not immediately obtainable I have found an ephedrine glucose gum preparation to be the most satisfactory substitute at present available (*J Obstet Gynaec Brit Emp* 1935 42 852 *British Medical Journal* 1936 2, 537). The ephedrine is omitted in cases of shock. Sometimes blood transfusion is required later but in many cases especially those of accidental haemorrhage, the simple infusion will suffice—I am, etc.,

Newcastle upon Tyne May 1

WM HUNTER.

SIR—Dr Malcolm D Black (*Journal* May 1, p 903) seems to strain at a gnat and swallow a camel when he states, cutting down on to a donor's vein should never be permitted and goes on to say, cutting down on to the recipient's vein is always advisable. One can quite well understand acute dilatation of the heart being included under the heading of 'dangers' when it is stated that twenty minutes at least should be taken in introducing 600 ccm.

I venture to suggest that the gravity method of blood transfusion is obsolete, and when used is sheer cruelty to the nurse who stands with arms aloft, perhaps the twenty minutes is the time limit of her endurance!

It is a simple matter in the most collapsed of patients to introduce a 17 gauge hypodermic needle even in the dorsum of the hand for argument's sake and to deliver the citrated blood at one's ease by means of a two-way syringe, personally I use a "Rotanda" (the small bore of the needle forces one to give a slow transfusion—one hour and twenty minutes will not be ill spent in giving 600 ccm of citrated blood). With regard to the mixing of the blood with the citrate solution I have found a sterilized Horlick's malted milk glass and mixer of great value—I am, etc.

Longtown Cumberland May 2.

R RUTHERFORD

Bran in the Prevention of Constipation

SIR—Having advocated the use of a "processed" preparation of bran as the best remedy for nearly all ordinary cases of habitual constipation (*Practitioner* 1935, 135, 229 *Med Press and Circ* 1935 191, p 336) and also to some extent as a preventive of chronic catarrhal colitis, I was most interested on reading confirmatory evidence in Dr E M Dimock's paper (*Journal* May 1 p 906). By retaining moisture the bran tends on the whole to make the contents of the rectum somewhat softer in constipated subjects and does not 'scrape' any

portion of the alimentary canal if taken with milk, soup, or fruit juice

Recently, however I read an article on colitis by a well-known medical authority on diet, in which he stated that if persons insisted on taking bran for spastic constipation it was no wonder that they should suffer from colitis. It seems to me that this question regarding the action of bran in spastic constipation depends on the amount of bran taken and whether it is taken during an attack or exacerbation or at other times.

All useful agents can in excess—or in relative excess as a result of temporary or permanent over sensitiveness or idiosyncrasy—also become harmful—I am etc.,

London W1 May 1

F PARKES WEBER

Angina Innocens

SIR—After reading the paper on angina innocens by Dr Geoffrey Bourne (*Journal* April 3, p 695) a recent case of mine appears to be an instance of this condition

An American lady, aged 37 was awakened from her sleep by a severe pain in the left precordial area which quickly radiated into the left shoulder and down the left arm into the fingers. She felt that she was being suffocated. The attack lasted for about fifteen minutes and passed off. This was followed by a series of similar attacks each lasting between ten and fifteen minutes with an interval of about half an hour between the attacks. Throughout this time she remained in bed.

I first saw her about three hours after the first attack. When I entered the room she happened to be in an attack. She appeared very shocked and seemed to be suffering great pain. No cyanosis was present. The heart was not enlarged. It was regular in action and the sounds were normal. The pulse rate was 58 a minute, blood pressure was 100/60 mm Hg. Nothing abnormal was found in the lungs or abdomen. She gave no history of any previous attacks but she had influenza a short time previously.

Inhalations of amyl nitrite failed to relieve the condition but after two injections of morphine she became free from pain and fell asleep. After some hours she wakened and apart from a feeling of soreness in the left arm she had no pain. After two days in bed without any recurrence of pain she refused to remain in bed any further. Her blood pressure remained at 100/60 mm Hg and the pulse rate was 62. The soreness in the left arm however was still present. That evening she got up and went ashore in Havana visiting Sloppy Joe's (internationally famous bar) where she consumed numerous rum drinks. She then visited several cabarets finally returning to the ship at five in the morning. I saw her later in the day and apart from the soreness in the left arm she was free from any discomfort. The heart and blood pressure were unaltered. She carried on in her usual manner including drinking and dancing, for another week when she left the ship. No signs of any pain had been felt and the soreness of the left arm had passed away.

I feel that this case is an example of angina innocens, as described by Dr Bourne—I am etc.,

R M S. *In press of Australia* April 30. ERIC F D OWEN

Prontosil in Septic Parotitis

SIR—A further important use for prontosil appears to be in the treatment of septic parotitis a condition notoriously difficult to treat in mental hospital patients. I saw a case of this kind with Mr Terry, senior surgeon of the Royal United Hospital Bath. The patient appeared to be in an ominously poor state. The external and internal swelling was very considerable, fever was marked and a minimal elevation of temperature seemed to indicate the poor reactive potentialities of the in-

dividual concerned, 5 c.cm of prontosil with two oral tablets daily were administered. Well within twenty four hours of the injection the patient's condition was considerably better. Recovery was uneventful. The tablets were discontinued on the tenth day, but before that day amelioration of the condition was very obvious. This minimal dosage by the intramuscular route was to some degree determined by difficulty in estimating the kidney tolerance of prontosil owing to inability to obtain specimens because of the patient's condition in relation to such matters.

In view of the depressing results of treatment of septic parotitis in mental cases this further extension of the usefulness of the new drug seems of undoubted importance—I am, etc.,

Bath April 28

Inhalational Therapy

SIR—So many points are raised in my mind by the letter of Sir H B Fawcett (April 17, p 837) that I will deal with the chief of them as I read his letter.

In his opening he claims to be a trustee for the Duke-Fingard inhalational treatment. It would be of interest if he would inform us of what his trusteeship consists, and when and where the exact formula of this inhalation has been published since so far as I know it is not generally known (see leading article, *British Medical Journal* January 23 p 175).

Putting aside his statement that he has been conversant with this particular form of therapy for so short a time as two years he states that he is quite convinced of its undoubted value in selected cases. I would point out that my patient was accepted as a suitable case apparently by one of their own selected list of doctors. Further ament the question of selection I quote the concluding paragraph of the article in the *Practitioner* of November, 1936:

"All the cases have been taken indiscriminately as they have applied for treatment. No case has been rejected on any medical grounds no matter how hopeless it appeared to be. Practically all have been chronic cases which have refused to respond to any other kind of treatment previously tried."

Sir H B Fawcett next remarks that he is well aware of the ethical policy which has been adopted in every instance. May I remind him that an ethical policy which permits the appropriation of another practitioner's patients is not one acceptable to the majority of his profession. It is true to say the patient is handed back after being drilled in the merits and applicability of this form of treatment to his own case.

We next pass on to a larger paragraph from which we may readily be led to a quibble over words. Surely Sir H B Fawcett will agree that for the purpose of advertisement it is not essential that the matter shall appear in the strict advertisement columns and be so labelled. The science of advertisement is far too subtle for such restriction and I can only tell him that my patient took his first step in the direction of treatment by reason of what he read in a lay Sunday paper. Evidently particular objection to the statement that my patient was referred to a medical man is taken by Sir H B Fawcett who so far as I can interpret his words, immediately proceeds to tell us how patients are referred under his ethical policy. I will be glad to withdraw my form of expression if a satisfactory explanation of any error is forthcoming.

In his concluding paragraph Sir H B Fawcus has read much more into my words than can be reasonably implied. Nowhere do I refer to the abrupt change in temperature, for I am assuming that my patient, being an intelligent person and having received such specific directions about the danger of 'abrupt change, would have carried out those directions. My assumption here may be unwarranted, for neither in the article in the *Practitioner* of November 1936, nor in the letter I received from the doctor who saw my patient in London, is mention made of the need for such precaution. On the contrary, I quote the following abstract from the doctor's letter to me:

I have found it advisable to commence treatment with three hours of the inhalation on the first day and if this is tolerated well by the patient to increase by three hours a day to a maximum of sixteen hours. As you will see this is an ambulatory treatment and the patient is able to carry on his or her normal occupation during the day. Any local or general treatment you think fit should of course be used in conjunction with the inhalation.

Proceeding further, I fail to find any suggestion in my letter that the adverse result was due partly to the inhaled vapour. Had Sir H. B. Fawcus read my letter carefully he would have noted that I described the early improvement in my patient's condition, and later the onset of an 'acute' bronchitis. He can take it from me that the ill effects were quickly apparent even to an untrained person, and that I took good care to modify the patient's treatment on well-established principles to the exclusion of any further exposure in the medicated room. The final sentence of this paragraph I would amend by the addition of two words so that it reads "Obviously one cannot merely switch on the specialist and leave the rest to the machine."

Finally, I would like to express my thanks to Dr A. C. Greenc for his helpful suggestions in the management of these cases. I would only suggest to him that there may be a danger to the chilly race of bronchitics in providing too thorough aeration, and that Nature may have some measure of wisdom in her method of restricting access to the lungs—I am, etc.,

Runcorn April 21

N A BOSWELL.

Hermaphroditism

SIR—Mr Harold Chapple's case of hermaphroditism (*Journal* April 17 p 802) can hardly be used to justify the conclusions of his article. What competent endocrinologist believes that the gonads *per se* determine the sex of an individual? In the case of a woman the ovaries are known to play a determining part in the sexual cycle, but for the sexual type as a whole the general glandular structure and function are responsible. While it is true that the hereditary formula of the ovum is the origin of the sexual type and of the glandular function, the latter's development becomes dependent on environmental conditions of many kinds, and most certainly does become responsible to a great extent for the sexual characteristics. Before Mr Chapple ventures to criticize emphasis laid on the significance of the gonads, he should surely pay due recognition to the all-important part played by the whole adrenal-pituitary-gonad complex in the sexual behaviour of an individual—I am, etc.,

London April 28

R. L. WORRALL.

SIR—I was interested in Dr Harold Chapple's report of an unusual case of hermaphroditism in the *Journal* of April 17 (p 802). I do not agree with his statement that this case proves that the sexual characteristics of the individual are independent of the gonads. Although the organ which was removed from his case presented the typical appearance of an atrophied testicle, yet microscopical examination showed that interstitial cells of the intratubular stroma were greatly developed. Is it not highly possible then, considering the general features of the case and the bisexual organs, that these interstitial cells, although situated in an apparent testicle, were secreting ovarian hormone. The overgrowth of these cells would probably account for the patient's sexual desire and intense feelings.

Previous experiments point very strongly to the fact that, had the adenomatous interstitial cells been secreting the male hormone, then she would have exhibited definite masculine characteristics. The removal of one of these organs lessened the patient's sexual ardour, which indicates that some endocrine activity in the glands directly affected her sexual life.

I have in my possession the gonads of a frog. One of these organs is a typical testis, while the other is composed partly of testicular substance and partly of the mottled ovarian tissue—I am, etc.,

London W.2 April 19

C HOWICK-SMITH

Birching of Children

SIR—It is important for those who advocate whipping as a justifiable corrective for the behaviour of children to realize that a very large element of sadism is responsible for this advocacy. Psychologists are universally agreed that no child should be whipped. When this latent sadism is realized people no longer desire to whip children and no longer think that it is good for them. It may not, in some cases, do much harm—there are so many ways, means, and circumstances—but it can never do them any good and often does much damage. Dr J. S. Clarke (*Journal* May 1, p 941) is mistaken, although I am sure quite sincerely, in his belief that children are improved by whipping and unfortunately many medical men appear to think likewise and will do so until a knowledge of psychology and of themselves is acquired. It has surprised me how few psychologists have contributed to the discussions on whipping in this *Journal*—I am, etc.,

London W.9 April 30

G W GARDE.

SIR—Surely the results of birching children are of far greater importance in helping a decision! Dr W. N. Maple has placed several facts before us in his letter in the *Journal* of April 17 (p 837). He deserves applause. Since judicial birching apparently does so little good why not let the psychologists see what they can do before condemning them and their methods?—I am, etc.,

Norwich May 2

MILLAR PAGE

SIR—Whilst on the whole agreeing with your excellent leading article on the birching of children I think it is very undesirable to spoil a good case by overstatement. I do not believe that children of 8 are birched. I do not believe that a child is tied up to a tripod whilst receiving its punishment, nor do I believe that the birch is soaked in brine. I have the support of chief constables of experience in this. For example the Chief Constable of Brighton says he has never heard of brine soaked birches, and the Chief Constable of Hove (who by the way states

that no child has been birched in Hove since 1923) says no tripod would be used if the necessity arose for whipping a child. Perhaps you will indicate what authority there is for the statements on this matter made in your leader—I am etc.,

Hove, April 23

L. A. PARRY

* The method of tying the offender to a kind of tripod was described by the Earl of Kinnoull in a speech in the House of Lords on July 25 1933 (Parliamentary Debates House of Lords Official Report vol 88 No 77, col 1083) and his statement was neither refuted nor challenged. The soaking of the birch in brine to prevent the twigs from splitting is so well established that phrases such as "a rod in pickle, etc." have long been in common usage. According to a report in the Press (Daily Herald, March 4 1935) a 13 year old boy who was sentenced at Newport (Mon) to six strokes of the birch had to wait four days for his punishment because the only available birch was too dry. On March 2 1937 the same newspaper reported that a 9 year old boy at South Shields had been ordered six strokes of the birch which left weals across his ribs and across an appendicitis scar, an effective complaint about this case was made to the Home Office by Mr J. Cluter Ede M.P. The procedure of birching may vary in different parts of England and Wales but the method described by Lord Kinnoull and discussed in our leading article is undoubtedly practised in many places other than Brighton and Hove. It is satisfactory to know that a Departmental Committee is about to consider the whole question and we may assume that all documents relating to the orders given by magistrates for such punishment and the details of its administration by the police will be in the hands of that Committee.—Ed. B.M.J.

Origin of the Westmorland Consumption Sanatorium

SIR—On account of my absence in South America throughout the winter I did not see until this week your obituary notice of my late friend Dr W. S. Paget Tomlinson in the *Journal* of February 20 in which you say

One of his most ambitious and valuable endeavours was the establishment of the Westmorland Sanatorium for Consumption at Meathop. His partner in this was Dr W. R. Parker of Kendal. There was no such sanatorium for the poor at that time in England; the Meathop institution was the pioneer. He was intimately associated with its activities and its development towards which he was a liberal contributor and he was its president at the time of his death. It was opened by the late Lord Derby in 1900 and it stands as a permanent memorial to the foresight and public spirit of Dr Paget Tomlinson.

Please allow me to supplement this. When six years ago I was a medical student at University College I was much impressed by several articles in "The Manchester Science Lectures" on the connexion between stuffy air and consumption. In 1883 while travelling about New Zealand for the Government Insurance Company I was struck by the absence of consumption and attributed it to the necessary ventilation of the universal wooden houses due to stiffening boards and I reported this opinion to the New Zealand Government. On March 9 1887 there appeared in the *British Medical Journal* a letter by me suggesting that if stuffy air was a cause of consumption in animals why not apply this to man and abolish consumption by open air treatment. In 1898 the *Practitioner*

published two special numbers on tuberculosis. I studied these with great avidity as confirming views which I had long held and supplying me with many new arguments. I immediately wrote sixteen consecutive articles in the weekly *Westmorland Gazette* under such headings as Consumption Preventable, Consumption Curable, "How to Prevent Tuberculosis in Cattle, etc." Failing to get any adequate support, I wrote to Dr W. S. Paget Tomlinson at that time a stranger to me but just then president of the Westmorland Agricultural Society, and he immediately backed me up warmly. We met nearly every week for months and through his influence were supported by numerous influential people and by March 1900 our sanatorium was opened by the late Earl of Derby—I am etc.,

WM. RUSHTON PARKER, M.A., M.D.

London April 25

Obituary

GEORGE PARKER, M.A., M.D., LL.D. (Hon.)

Consulting Physician, Bristol General Hospital

On April 27 at his residence in Clifton Dr George Parker died in his eighty-fourth year after a long illness. Born at Claverdon Hall, Stratford, he was educated at Cambridge House, Stratford-on-Avon and at St John's College, Cambridge, where he took honours in two triposes, moral sciences and history, proceeding to the B.A. degree in 1877. For a time he remained in Cambridge as a coach for the Moral Sciences Tripos. He then passed the first and second examinations for the M.B. degree and continued his medical studies at St Bartholomew's Hospital. He graduated in medicine in 1884 taking the M.D. degree without the preliminary M.B. because he had already taken his M.A. in 1880.

He held the appointment of resident medical officer at the Paddington Green Children's Hospital and after a period of study in Vienna settled to practise in Bristol in 1887 with an appointment as medical officer to the Bristol Dispensary. In 1892 he was appointed assistant physician and in 1901 became physician to the Bristol General Hospital, for a time he took charge of the newly founded electrical department in that hospital. For many years he was lecturer in medical jurisprudence in University College and the University of Bristol. He was an active member of the British Medical Association, was president of the Bath and Bristol Branch in 1911-12, and for several years was a member of the Central Council and of the Representative Body. He also held the office of president of the Association of Physicians of Great Britain and Ireland in 1924 when that association met in Bristol.

Dr Parker was President of the Bristol Medico-Chirurgical Society in 1915-16 and honorary medical librarian to the University of Bristol from 1930 up to the time of his death. During the war he was on the *a la suite* staff of the Second Southern General Hospital (T.I.) in Bristol with the rank of major and subsequently lieutenant colonel.

As a physician Parker was cautious, sound and wide informed. As a teacher he was clear, impressive and interesting. But it was as a medical historian that he gave his talents their fullest play. His *Early History of Surgery in Great Britain* was incomparably the best account that has been written. His researches revealed

many facts previously unknown, his erudition was great and his accuracy in tracking information to its earliest sources was amazing

With all his learning Parker never became pedantic history in his hands always took the form of a coherent and entertaining story His knowledge of the medical history of Bristol was inexhaustible He compiled lists of physicians surgeons, and apothecaries who had practised in Bristol from the earliest times, and ferreted out their biographies with infinite zest Correspondents from all over the world would write to Parker for information about Bristol practitioners from the Middle Ages to modern times and whatever there was to be known about them he had their records and shared his knowledge freely and generously In 1933 Parker wrote a history of the Bristol Medical School for its Centenary, and the account he then compiled of the earliest schools of anatomy, surgery, and medicine in Bristol was a pattern of exact documentation and admirable illustration He hunted out the history of the old monastic hospitals in Bristol and identified their sites In his later years he was associated with Sir Flinders Petrie in exploration in Palestine and the Near East, where he acted as medical officer to the expeditions In 1927 he delivered the Vicary Lecture at the Royal College of Surgeons on "Early Hospitals" In 1934 the University of Bristol, in recognition of his labours as a University lecturer, as honorary medical librarian, and as the chronicler of Bristol medical history, conferred on him the honorary degree of LL.D

George Parker was the most modest of men, kind, courteous, and companionable, he was a universal friend and will be deeply mourned Deep sympathy is felt with his sister, Mrs Stokes

J A N

JOHN WALDY FRCS

Mr John Waldy of Green Park, Darlington, died on April 25 at the age of 76 He was the eldest son of the late Mr Edward Waldy of Barmpton, near Darlington He was educated privately, and joined the Medical College at Newcastle upon Tyne (Durham University) in October, 1877, where he acted for some time as assistant demonstrator of anatomy He passed the primary examination for the FRCS in May 1880 being one of a batch of the first five students to do so without being coached in London In October, 1881, he went to St George's Hospital, and became M.R.C.S in 1882 and L.R.C.P in 1883 He acted as assistant medical registrar at that hospital. In 1887 he was admitted a Fellow of the Royal College of Surgeons He was from 1883 a house surgeon, and later senior house-physician, at the Royal Victoria Infirmary, Newcastle for four years being the last resident to be appointed without a time limit Sir George Hare Philipson was then the senior physician of that institution, and many are the droll stories Waldy could tell of that quaint personality On leaving the Infirmary he joined Dr John Hanley Hutchinson at Catterick, and they soon had a most extensive practice in North Yorkshire, requiring at one time eleven or twelve horses to run it Waldy had often to leave home at 8 or 9 a.m., drive a tandem himself and not return home from his "round" until late in the afternoon Hutchinson had been a contemporary of Sir William Gowers as a student at University College, and was a physician of great ability

About thirty-five years ago Mr Waldy moved to Darlington as a consultant surgeon and enjoyed the confidence of the people and doctors of Darlington and district for many years, though he did not hold any hospital

appointment - In 1930 his sight began to fail and four years ago other painful diseases developed, and he had been confined to bed constantly for the last year and a half The end came suddenly, and he was buried, after being cremated, in the family burial ground beside his first wife who died in 1930, in the churchyard of Haughton-le Skerne He leaves a widow, but no children

He was of a gentle and retiring disposition, and kind to rich and poor alike His methods were slow and somewhat hesitating, but most painstaking and thorough It was these two last qualities which gave his patients such complete confidence in him He cared nothing for society or sport His leisure hours, which were few, were spent at home He was a student all his days, being interested in medicine as well as in surgery He was a teetotaler and a non smoker, and was very fond of horses and dogs, often saying that if he had not been a doctor he would have been a farmer He was a member of the British Medical Association for many years

W R

T G MACAULAY HINE, M.A., M.D

Thomas Guy Macaulay Hine, who died on April 25 aged 66, was the son of the late George T Hine, FRIBA, consulting architect to the Royal Commission in Lunacy, who built some of our largest asylums, including Claybury Dr Hine was educated at Charterhouse, King's College, Cambridge, and St Bartholomew's Hospital, graduating M.B.Cantab in 1904, and became house physician to Sir Norman Moore He then took up bacteriology, and did some research work on the group of organisms that includes the diphtheria bacillus Possessed of a competence, he was able to follow his own bent during the following years, but in 1915, during the first winter of the war, Hine's services were invited as officer in charge of the Central Laboratory that had been formed at Millbank to deal with outbreaks of cerebro spinal fever among troops Hine, who was a trained engineer as well as a doctor, thoroughly entered into the work, devised, set up and presided over a medium making department, prepared standardized, and sent out suspensions of meningococci of various types and agglutinating sera, and latterly distributed specimens of monotypical serum specially prepared for therapeutic trial, and assessed the results in a special report He took over the problem of the mass disinfection of the nasopharynx in meningococcus carriers, and designed a special jet that was operated by steam or compressed air and was particularly effective in keeping the air of inhaling rooms charged with droplets of a 1 in 50 solution of zinc sulphate In this way an efficient NCO, by making his men inhale the atmosphere vigorously through the nose while in the inhaling room, could free them temporarily of the meningococcus. Although the meningococcus in most cases gradually returned, the treatment was useful in reducing the abundance of the meningococcus in droplets expelled during the night into the air of Army huts when carried out that thing, and so helped to check the spread of the disease

For his services during the war Dr Hine received the O.B.E. and was given the honorary rank of major During recent years he had lived in retirement in Devon In 1918 he married Miss Margaret Lillywhite who survives him with a son aged 16 and a daughter His sister Mrs Coxon is the well known novelist Muriel Hine At one time Dr Hine was Master of the Fruiterers Company, and he was a popular figure in lay as well as medical circles in the City of London and elsewhere

M H G

DR ARCHIBALD DONALD

Dr Judson S Bury sends the following tribute Archibald Donald was one of my dearest oldest and best of friends and having shared in his happiness and his sorrows and rejoiced in his successes and honours I should like to say something of his personality and character even though my words can only be an echo of the sentiments so admirably expressed in the *Journal* of April 24 by other colleagues. They have given just testimony to the originality of his pioneer work in gynaecology to his operative skill and to the many advances he introduced in the technique of treatment. There can indeed be no question that Donald's work has had a powerful stimulating influence in the development of gynaecology in this country. Above all, his colleagues lay stress on his reticence in referring to his own discoveries. One instance of this reluctance to speak of his own work is seen in his Lloyd Roberts Lecture entitled *The Transition*. I have just reread it and although there is ample acknowledgement of the investigations of his colleagues I can find no reference to his own. Modesty was certainly one of his most characteristic features but behind this modesty those who knew him well realized that there was a strong personality a transparent honesty of purpose a well-balanced mind and a kindly judgement of others moreover he had the saving grace of humour and an unostentatious generosity. He was constantly doing kindly actions unwearied and indefatigable in his labours for his patients and his students taking infinite pains both in the treatment of patients and in his teaching. His extreme solicitude for the welfare of others was outstanding. His example and his lovable disposition gave him an influence which is woven into the lives of his disciples and his friends. To few has been given a life so fully and so nobly wrought. Can it be wondered that he was so greatly loved so profoundly respected by all who knew him? His last lingering illness was borne with the greatest fortitude and resignation. It is good to know that the end came in his beautiful country home to which and the fine garden he was so much attached. When a few days later we gathered round his resting place in the graveyard of the church at Nether Alderley we knew that we were bidding farewell to an English gentleman of old-world courtesy and it was sad to think that never again should we be able to see his charming smile or listen to the gentle wisdom of his observations. No kinder eyes have ever been sealed by the dust of death. I believe that Donald would have been willing to say of himself

I have loved no darkness
Sophisticated no truth
Nursed no delusion
Allowed no fear

We shall cherish of him a memory that will always be green especially to those who knew his humanity and esteemed his sterling worth

Dr JOHN AUGUSTUS SPEAR died at Guildford on April 15 at the age of 65. He was the son of the late Dr J Spear a distinguished inspector of the old Local Government Board and received his education on the Continent and then at St Bartholomew's Hospital. Shortly after qualifying as M.R.C.S. I.R.C.P. he took up an appointment in Brazil with the St John Del Rey Mining Company for many years. British Vice Consul for the State of Minas Geraes. J. G. I. H. writes. By the intimate friends of the late Dr J A Spear a lasting sorrow will be felt for the loss of one whose strong personality must have left an indelible impression on all with whom he came in contact. His brain power was far above the average which enabled him to pass the primary fellowship examination with unusual ease. That he never proceeded to the final examination was mainly due to his loss of interest and his moderate administrative duties which he held for many years. His memory is still more to him than his name. An old

reader he was familiar with the best of English literature and his retentive memory and happy mode of expression made him an ideal companion. Pomp ceremony and the vanities of this world were to him things of nought. His enduring interest lay in his books and in the hope of finding therein a solution of the problem of the universe which has for ever baffled mankind. Games did not interest him and he had no real heart for field sports, killing being repugnant to his nature. In his younger days his physical energy and impatience at delay earned him the wholesome respect of the native and European population with whom he had to deal. His fiercest tirades were more often than not a prelude to some act of pure philanthropy and his outspoken criticisms lost their sting as the underlying sense of humour came to light. He leaves behind him a devoted wife, and to her all his friends will extend their sympathy.

Dr ROBERT SPIERS FULLARTON who died after a short illness at Helensburgh on April 17 was formerly professor of physiology at Anderson College and a divisional medical officer of health in Glasgow. The eldest son of Colonel John Fullarton of Kilmacoll he was born in 1867 and graduated M.A. of the University of Glasgow in 1886. After some years he took up the study of medicine, and obtained the M.B. and Ch.B. degrees with honours in 1898 proceeding M.D. in 1911. Meanwhile he had been elected a Fellow of the Royal Faculty of Physicians and Surgeons in 1903 and afterwards took the D.P.H. of Edinburgh and Glasgow. For some years Dr Fullarton was resident assistant physician at the City of Glasgow Fever Hospital and later acting superintendent of the City of Glasgow Smallpox Hospital. With Dr R. S. Thomson he published statistics relating to vaccination and smallpox in the last named institution between April 1900 and June 1901. He joined the British Medical Association in 1914, and was honorary secretary of the Section of Public Health at the Annual Meeting in Glasgow fifteen years ago.

We regret to announce the death of Dr FRANCIS MURRAY HAIG which occurred at his home in Woking on April 22. He was the second son of Major General F. T. Haig, R.E. and studied medicine at the University of Cambridge and St Thomas's Hospital. He took his M.A. in 1882 and qualified as M.R.C.S. and L.S.A. in 1885 proceeding to the M.D. and B.Ch. degrees in 1887. Dr Haig had held the posts of house physician at St Thomas's and honorary medical officer to the Woking Cottage Hospital and St. Peter's Convalescent Home. For some years he was in active ophthalmological practice in the Midlands and was elected ophthalmological surgeon (afterwards consulting surgeon) to the Coventry and Warwickshire Hospital. He had been a member of the British Medical Association for just on fifty years.

Dr LUKE GERALD DILLON O.B.E. who practised at Seaham Harbour for half a century and was medical officer of health for more than forty years died on April 27 at Oxford where he was living in retirement. Born in 1862 he was educated at the Jesuit College, Galway and the Queen's University of Ireland graduating M.D. and M.Ch. in 1882. Dr Dillon was one of the pioneers of ambulance work in the North and in recognition of his work was made an officer of the Order of St John. He was gazetted surgeon captain 2nd Durham Volunteer Artillery Brigade in 1894 and retired with the rank of surgeon major. In 1914 he was placed in charge of recruiting for a large area around Seaham and had medical charge of all troops in the district for the period of the war. He was also medical officer in charge of Seaham Hill Auxiliary Military Hospital and Seaham Infirmary. After the armistice he became demobilization officer at Seaham and subsequently medical referee under the Ministry of Pensions. In 1912 Dr Dillon was appointed a magistrate for Durham County.

and regularly attended the courts at Seaham, and he was chairman of the Durham County Panel Committee for twenty one years in succession. As M.O.H. for Seaham he spared no effort to obtain better housing and a higher standard of living for the workers, and he was co-opted a member of the Health Committee of Durham County Council. On retirement from public office three years ago he was entertained to a dinner and presentations were made to him. He had been a member of the British Medical Association for forty years.

The Services

HONORARY SURGEON TO THE KING

The King has approved the appointment of Colonel W. J. Powell C.I.E. I.M.S. Honorary Surgeon to the Viceroy of India as Honorary Surgeon to the King, in succession to Major General A. W. M. Harvey, I.M.S., who has retired.

DEATHS IN THE SERVICES

Major General Sir (MICHAEL) THOMAS YARR K.C.M.G. C.B., late R.A.M.C. died in a nursing home in London on April 24 aged 74. He was born at Cloughjordan, County Tipperary on October 17 1862 the son of Thomas Yarr J.P. of Rathgar, Dublin and was educated at French College Blackrock and in the Medical School of the Royal Irish College of Surgeons, studying subsequently at Paris and Vienna. He took the L.R.C.S.I. and L.K.Q.C.P. in 1882 and subsequently the F.R.C.S.I. in 1894. After filling the post of chief clinical assistant at the Royal London Ophthalmic Hospital he entered the Army as surgeon on January 30 1886 passing first into Netley. He attained the rank of colonel in the long war promotion list of March 1 1915 became major general on December 26 1917 and retired in 1921. He had a more varied experience of service than falls to the lot of most Army medical officers. From 1890 to 1895 he was surgeon to the 1st Battalion of Coldstream Guards and from 1895 to 1899 was seconded as Physician to the Crown Prince of Siam. He served in the South African War in 1900-1 taking part in operations in the Orange Free State the Transvaal and Cape Colony and gaining the Queen's medal with four clasps. From 1903 to 1908 he was surgeon to the Governor of Bombay. He then served throughout the war of 1914-18 first as A.D.M.S. at Gallipoli where he took part in the landing and in the operations of the 29th Division, and later as D.D.M.S. of the Egyptian Expeditionary Force and at Malta was mentioned in despatches in the *London Gazette* of August 5 1915 and received the C.B. in 1916 the K.C.M.G. in 1917 and was made a Chevalier of the Legion of Honour. After the war he was Inspector of Medical Services to the War Office a post which involved much travelling abroad. Throughout his career he specialized in ophthalmology and was the author of *A Manual of Military Ophthalmology* and of many papers and articles on his specialty. After retirement he served on the board of management of St David's Home for Crippled Soldiers at Ealing and of the Royal Normal School for the Blind at Norwood. He was unmarried.

Surgeon Commander JOHN WILLIAM TIGHE R.N. (retired), died at Castlereagh County Roscommon on April 4. He was the only son of Dr J. M. Tighe of Melbourne was educated in Dublin and took the L.R.C.P. and S.I. in 1920 after which he entered the Navy. He became surgeon lieutenant commander on February 12 1927 surgeon commander in 1935 and retired in May 1936.

Lieut.-Colonel FREDERICK J. GARLAND D.S.O., R.A.M.C. (ret.) died on April 29 aged 59. He was born on November 5 1877 and was educated in the Royal University of Ireland where he graduated as M.B. B.Ch. and B.A.O. in 1901. Entering the R.A.M.C. as lieutenant on January 30 1904 he became major on July 1 1915 during the war and retired as lieutenant-colonel on May 18 1929. Before entering the Army he served as a civil surgeon for over a year. He served in the war of 1914-18 when he was mentioned in despatches in the *London Gazette* of July 21 1917 and June 11 1918 and received the D.S.O. in 1918. After retirement he was employed for some years at Lydd.

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

At a congregation held on May 1 the following medical degrees were conferred:

M.B., B.Chir.—*G. D. Pirrie *A. B. Evans *P. J. Wenger
Byrne A. H. Knowles N. A. Buxton L. A. Collins G. C. L.
Pile H. T. H. Wilson F. I. Evans L. N. G. Lytton A. C. Blands
A. A. D. La Touche, I. W. MacKichan D. S. Scott, E. D. Hoare
R. J. Porter

M.B.—*H. Sandeman Allen *G. C. Milner *H. C. MacLaren,
*A. Monk Masoo Payne, *F. Bush, *J. F. Lown *W. A. Briggs

UNIVERSITY OF LONDON

The following candidates have been approved at the examination indicated:

POST-GRADUATE DIPLOMA IN PSYCHOLOGICAL MEDICINE—(With
Special Knowledge of Mental Diseases) G. A. FitzPatrick
Part A G. L. Ashford Augusta G. Harrison

LONDON SCHOOL OF HYGIENE AND TROPICAL MEDICINE

The course of study for the Diploma in Public Health covers a period of nine calendar months whole-time work and commences on September 28. The fee is 54 guineas. One fishmongers Company Studentship which is awarded annually, carries remission of fees for the course and the next examination for the studentship will be held on June 22 and 23. Applications to compete must reach the secretary London School of Hygiene and Tropical Medicine Keppel Street Gower Street London W.C.1 by June 14. A fuller announcement appears in our advertisement columns this week.

UNIVERSITY OF DURHAM

At the summer convocations the honorary degree of Doctor of Science will be conferred on Sir Henry Dale M.D., F.R.C.P. F.R.S., director of the National Institute for Medical Research and the honorary degree of Doctor of Surgery on Mr R. P. Ranken Lyle Emeritus Professor of Midwifery and Gynaecology in the University.

The centenary of the foundation of the University will be celebrated at Durham on Thursday, July 1 and at Newcastle on the following day. Invitations are being issued to other universities and educational bodies to send representatives, and a number of honorary degrees will be conferred.

UNIVERSITY OF MANCHESTER

The Rockefeller Foundation has made a grant of £5,000 to be spread over four years, in support of the research work in biochemistry being carried out under the direction of Professor Heilbron.

Dr Donal Sheehan has resigned his appointment as lecturer in neuro anatomy on his appointment as Professor of Anatomy in the College of Medicine New York University.

The conferment of degrees in science and medicine will take place on Saturday July 10 in the morning.

ROYAL COLLEGE OF PHYSICIANS OF LONDON

A meeting of the Royal College of Physicians of London was held on April 29 with the President Viscount Dawson of Penn in the chair.

The following were elected Fellows of the College:

Arthur Cecil Alport M.D. Ed. Thomas Pearce Williams M.D.
Lond. William Noel Goldsmith M.D. Camb. Henry Fitzgerald
Maudsley M.D. Melb. (Melbourne) Lewis Ralph Yealland M.D.
Ontario Francis Joseph Bentley M.D. Durh. Ernest Noble
Chamberlain M.D. Liverp. (Liverpool) Francis Wiremu Brian
Fitchett M.D. Ed. (New Zealand) Jeffrey Ramsay O.B.E., M.D.
Lond. (Blackburn) Frank Dutch Howitt C.V.O. M.D. Camb.
Oscar Brenner M.D. Birm. (Birmingham) Benjamin Branford
Morgan M.D. Ed. (Norwich) Douglas Kinchin Adams M.D. Glas.
(Glasgow) Percy Selwyn Selwyn-Clarke M.C. M.D. Lond.

period of instruction. When they arrived at a certain age and were thrown out on the streets they were useless and had a wrong mentality.

WORKING HOURS OF JUVENILES UNDER 16

SIR JOHN SIMON said he had studied this subject at the Home Office and had been making inquiries for some time. As far as the present law was concerned in the matter of permitted hours young persons between 14 and 18 and women of any age were all treated on a level. The hours at present permitted for women and young persons were fifty five and a half in textile factories and sixty in other factories. In most cases these hours were never touched. At present there was an agreed working week—say of forty-eight hours—and in addition a large quantity of overtime which might extend over the whole year. The present Bill contained a gradation as regards hours and it was for the Committee to decide whether that gradation was steep enough. There was a statutory limit of forty-eight hours a week for women with permissive overtime limited both in number of hours and number of weeks. For young persons between 16 and 18 the hours were forty-eight a week with a more limited provision concerning overtime, and for persons between 14 and 16 there could not be any overtime. Then came the question whether the Committee could do better than in the Bill as regards juveniles between 14 and 16. He hoped that they could. In the recent Shops Act forty-eight hours was deliberately fixed for young people between 14 and 16 in shops. In the unregulated trades such as the work of page boys in hotels, boys working lifts and so on forty-eight hours had been recommended for juveniles between 14 and 16. Therefore the Bill did not lag behind recent standards either adopted or recommended, but the Committee ought to endeavour to go further.

The problem of interdependence of juvenile and adult work in the cotton industry was difficult and if a substantial difference in the number of hours worked by youthful helpers and others was suddenly decided upon, very serious reorganization would be required in those industries. He had received help from the Factories Department in this matter and had begun to make inquiries outside in various industries. Before the Bill left the House of Commons he would like to see a reduction in the permitted hours of juveniles between 14 and 16. He had asked the medical advisers to the Home Office whether they thought the existing forty-eight hours could be said to be injurious to health and they replied that on present information this could not be said though they would be glad to see more time for leisure and recreation. The Committee must remember that when it talked about forty-eight hours for these young persons it meant working that number of hours week in week out with the exception of very limited holidays and at times when young persons did not feel as fit as usual. That had to be borne in mind even although his impartial advisers could not say that a forty-eight hour week for these juveniles proved injurious to health.

HOURS TO BE REDUCED

MR GIBBINS asked whether the Ministers' medical advisers when suggesting that forty-eight hours a week between 14 and 16 was not injurious had had regard to the consequences later in life for young persons who worked those hours. SIR ERNEST GRAHAM LITTLE asked whether Sir John Simon knew the unanimous opinion expressed in the medical press on this subject.

SIR JOHN SIMON said on general grounds it would be better to get the hours reduced and he would endeavour to secure on the floor of the House that the Bill was altered to provide that for juveniles between 14 and 16 years of age the maximum permitted hours of working should be reduced by statute beyond what was provided in the Bill. He had not yet sufficient information on what the new number of hours should be. It would not be possible to introduce the provision as early as other provisions in the Bill and there must be time for important industries to reorganize but they could possibly bring the improvements into force within two years. They must leave to an industry the opportunity of proving,

if it could that in each case a figure differing from the new statutory figure—but not necessarily as much as forty-eight—was justified. The industry would have to prove first that the hours could not reasonably be regarded as injurious to the health of young people secondly that the proper carrying on of that industry made it desirable that young people should work these longer hours side by side with their elders and thirdly that juveniles would be engaged in such work as would familiarize them with and train them for processes in which the older people were employed and would be likely to lead up to their employment as adult workers in those processes.

MR SILKIN asked if the modified proposals would apply only to children between 14 and 16. SIR JOHN SIMON replied that this was so. MR VIANI said the Opposition were disappointed at the speech of the Home Secretary. The Committee ought to be ready to limit the hours of labour to forty for young persons and the industrialists would fall into line.

The discussion was adjourned until April 22 when SIR JOHN SIMON said that on further reflection he did not think it would be a good plan for the Committee to pass the Bill back to the House without making any adjustment in the matter of juveniles under 16 and to wait for the Report stage for new proposals to be tabled. The modifications he had sketched out would come into force after an interval possibly of two years and would have to be expressed in a clause which provided that after that interval the figure 48 would be altered to a smaller one. That could properly be done in a new clause which would follow the one on the general conditions as to hours of employment of women and young persons and he undertook that the Government would put down a new clause during the Committee stage.

MR W. W. WAKEFIELD said the new clause would deal only with young persons from 14 to 16 but the progress of education was such that before long young persons under 15 would not enter industry, and the new clause therefore would deal only with persons between the ages of 15 and 16. He asked the Home Secretary to reconsider the hours of work of young persons of 16 to 18.

MEDICAL OPINION

SIR ERNEST GRAHAM LITTLE said medical and educational arguments made a special class of the children from 14 to 16 years. That class was relatively small and would be smaller in the near future. Medical opinion unanimously wished to restrict the hours of labour of children from 14 to 16 years. In that period the whole structure of the child's physical and psychological changed. The mental and physical state of the child in those years was in turmoil. The child ought not to be in a factory at all. When the child left school at 14 years of age and went into a factory he was unfitted for this complete break and soon lost the keenness and enthusiasm which he acquired in school. The work done by children in factories at that age was not a preparation for trade and there was a great period of indolence instead of mental activity because of the absence of incentive. At 18 when the children were thrown again on the labour market they were lifeless persons whereas the child at 14 was intellectually curious and anxious to learn more.

The Committee then divided on the amendment moved by MR ALFRED SHORT on April 22 to insert the word "forty" for the words "forty-eight" and this was defeated by 24 to 15.

MR RHYS DAVIES moved an amendment to provide that the period of employment for women and young persons should not exceed ten hours in any day instead of the eleven hours specified in the Bill. MR GEOFFREY LLOYD said MR RHYS DAVIES confused the hours of employment with the period of employment. The period of employment was made up of the hours of employment plus intervals for meals and rest. The amendment would confine the employment period to a shorter time by restricting meal times and rest intervals. The amendment was withdrawn.

The Committee agreed to an amendment substituting 7 a.m. for 6 a.m. as the hour at which employment of women and young persons in factories might begin. He said reports of

inspectors showed that nowadays factory employment did not begin before 7 a.m. unless there was a special reason for doing so and the Government was prepared to agree that it should not begin before that hour except in special cases authorized by the Home Secretary. A new clause would be moved later on dealing with exceptions as to the hours of commencement.

Mr. SILKIN moved to substitute 6 p.m. for 8 p.m. as the hour at which on days other than Saturdays the employment of women and young persons in factories should cease. He said this was to meet the concern felt for the physical fitness and continued education of young children. Mr. BROAD approved the application of the amendment to women, of whom a great proportion had to keep their homes going, do shopping and housework and look after children or even maintain disabled husbands although they worked in factories. Lady ASTOR supported this argument and said that girls all over the country were going to factories from long distances as the new housing estates had not been built around the factories.

Mr. GRIFFITH LLOYD said the hour of stopping work was governed in practice by the hour of starting. In a number of factories the work started relatively late at 8.30 a.m. or 9 a.m. and in other factories longer meal times were given or both circumstances prevailed so that work continued until 6.30 p.m. or 7 p.m. or perhaps until 7.30 p.m. or 8 p.m. on some days for the convenience of the workers. These conditions were largely settled in consultation with the workpeople.

There was some further discussion after which Mr. LLOYD said he was impressed by the way in which members had put their objections. It was not reasonable to say that an adult woman could not start work at 8.30 a.m. or 9 a.m. in any circumstances but young persons had a special case. If the Committee would pass the clause as it stood the Home Office would reconsider it and ask the assistance of Opposition members in pointing out examples where the proposed hours would constitute an abuse. It was not safe to make a concession at this stage. Mr. Silkkin's amendment was then withdrawn.

Mr. GRAHAM WHITE moved to omit the words "or young persons" from a subsection of Clause 68 which provides that a woman or young person could be employed up to four and a half hours without an interval for meal or rest or up to five hours if a break of ten minutes was allowed in the course of the spell. He said this amendment was made in conjunction with the other amendment for limiting the spells of work for young persons to three and a half hours. Mr. LLOYD said the provision in the Bill was put in as a result of the experience of the Factory Department to provide the intervals and rest pauses which were necessary and to avoid unnecessarily long rest pauses which were resented by the workers concerned. As a result of work by the Medical Research Council these proposals had been incorporated in the Bill. The Committee negatived the amendment.

Sir ERNEST GRAHAM LITTLE moved to substitute three hours for four and a half as the length of the continuous spell. He said it was established that spell of work of more than three hours was so long that the attention of the mind and the incidence of accidents was largely increased by intention. Three hours was enough to exhaust the capacity of a child of 14 to 16. He asked whether it was not possible in this provision to separate women from children. There was no reason to separate women from men from the medical point of view, but reason to separate women from children. Mr. GRIFFITH LLOYD and the conclusion that three hours was the maximum spell that should prevail was not the conclusion to which the Industrial Health Research Board came after examination of sickness records and so on. The Board concluded that it was impossible to obtain reliable evidence as to the length in the duration of work spells affected by fatigue. The effect of medical opinion in this matter was confused, but reports of factory inspectors tended to show that it was not at the end of a period of work, even in terms of hours, that a decision was required. They tended to show that the length of work or during periods of

Sir Ernest Graham Little's amendment was negatived.

Mr. WHITE moved to leave out the permission allowing the working spell to be five hours with a ten minute break but this was defeated by 22 to 9. The Committee then adjourned until April 27.

INTERVALS FOR MEALS

When discussion was continued on April 27 Mr. SILKIN moved to provide that where young persons were employed during the hours of 11.30 a.m. and 2.30 p.m. an interval of not less than three-quarters of an hour should be allowed between those hours for dinner if taken in the factory or in a building of which the factory formed part or of one hour if not taken in such buildings. Sir JOHN SIMON said the existing powers of the Home Office as regards welfare orders did not give an actual mandatory power to make directions on the length of the interval for meals. The amendment was negatived and the CHAIRMAN then suggested that amendments on the paper dealing with the employment of women before and after childbirth should better be discussed as a new clause. Mr. GRAHAM WHITE and Mr. RHYD DAVIES agreed to this.

On the motion that Clause 68 as amended stand part of the Bill Sir WALTER SMILES said that he had made inquiries in Blackburn from working people themselves and found they preferred children to go to work before they were 15 and to work forty-eight hours a week. They pointed out that the children got better discipline in the factories than they seemed to do in the schools. Sir ERNEST GRAHAM LITTLE said no part of the Bill aroused more attention from medical and educational authorities than the reduction of hours for young persons between 14 and 15 and if possible between 16 and 18. Sir JOHN SIMON said there would be later opportunities for debating this matter. By supporting the present clause Sir Ernest would promote the object he had in view. Lady ASTOR asked whether on the new clause the Committee could discuss the hours of those from 16 to 18. Sir JOHN SIMON said these had been discussed on Clause 68. The new clause would deal with persons between 14 and 16. Overtime for persons between 16 and 18 would arise on Clause 70.

The Committee approved the clauses amended by 34 to 25 to 18. Clause 69 (Notice fixing hours of employment) was ordered to stand part of the Bill without discussion.

THE QUESTION OF OVERTIME

On Clause 70 (Overtime employment of women and young persons over 16) Mr. ELLIS SMITH moved to leave out the reference to young persons who had attained the age of 16. After discussion Sir JOHN SIMON said the present legal hours for young persons between 16 and 18 in a year were 3,640 taking out one week for statutory holidays but the Bill would reduce that total to 2,550 hours in a fifty-one week year or ten hours a week less. Even this limited amount of overtime ought not to be allowed in an industry injurious to the health of young people and a subsection of Clause 70 had been inserted to meet any case which might arise of increased hours over forty-eight being injurious to health. The Home Office had no interest in overtime but he was not prepared to say that a young man of 17 was less capable of doing two or three hours overtime than the average woman.

Mr. ELLIS SMITH's amendment was defeated by 34 to 19 and an amendment to provide that no young person should work more than fifty hours overtime in any calendar year was also defeated.

The Committee adjourned till April 29. On resumption Mr. RHYD DAVIES moved that the overtime in the factories should not exceed in the aggregate 100 hours in any calendar year or 15 hours in any week, nor occur in more than thirty days in any calendar year. The chairman ruled the amendment out. Other amendments on the same subject were moved and withdrawn.

Sir JOHN SIMON moved an amendment to enable the Home Secretary to order an inquiry by a representative committee that in any class or description of factory the overtime allowed under the Bill could be reduced without the consent of the industry. After the inquiry the Home Secretary would make regulations reducing the amount of

overtime of women or young persons employed in this section of the industry. The amendment was carried by 23 votes to 12. The Committee agreed to a further amendment moved by Sir John Simon enabling him in special conditions to provide that no woman should be employed overtime for more than seventy-five hours and no young person for fifty hours in any calendar year and that neither except as otherwise provided in regulations should be employed overtime in a factory more than six hours in any week or in more than twenty-five weeks in the calendar year. The clause as amended was then added to the Bill by 22 votes to 9.

Clause 71 (Supplementary provisions as to overtime) was also added to the Bill after proposed amendments dealing with holidays had been defeated.

The Committee adjourned until May 4.

Maternity Services in Scotland

In the House of Lords on April 27 Lord STRATHCONA moved the second reading of the Maternity Services (Scotland) Bill which has passed the House of Commons. He explained that the main purpose of the Bill was to improve the standard of domiciliary midwifery in Scotland. It aimed at providing a domiciliary midwifery service of high standard securing adequate nursing and medical and specialist obstetrical services for women confined at home. Scottish medical men took a much larger part in midwifery practice than English doctors. The Bill took account of this fact and was therefore not limited to a midwife service only. Under the arrangement proposed every expectant mother who desired to be confined in her own home would be entitled to obtain the services of a midwife and a doctor. If the need arose the doctor would be at liberty to call for the advice or help of an obstetrician of recognized standing. A thorough system of ante-natal and post-natal care would be a fundamental feature of the scheme. The idea was to have a co-ordinated service of the midwife and the doctor acting in co-operation with the assistance if need be, of the expert obstetrician.

Local authorities would be free to select the type of arrangements they preferred for securing the medical services so long as the services were adequate. In some areas medical arrangements other than those relating to obstetricians might be made with all general practitioners in that area who were willing to take service on the terms offered by the local authority. In others the ante-natal and post-natal examinations might be carried out at the authority's clinics, and arrangements made either with all practitioners or a limited number of those in the area to provide the intra-natal service. No insuperable difficulty was anticipated in securing the services of qualified obstetricians in most areas. Adjoining areas might in some cases find it desirable to combine for the purpose of this specialist service. As in the case of the midwife service the local authority was required to consult with any local organization representing the medical practitioners in the area before submitting its proposals for the Department's approval and any such organization if dissatisfied might make representations to the Department.

The remuneration of midwives and doctors participating in the service would be a matter for negotiation between the local authorities and those with whom they proposed to enter into agreement or their representatives. As those fees would be payable by the local authorities one of the beneficial aspects of the scheme would be the elimination of bad debts which had hitherto been a source of much worry particularly to midwives.

MEDICAL STUDENTS AND DOMICILIARY MIDWIFERY

Clause 6 of the Bill the object of which was to prevent the attendance of unqualified persons on women in childbirth contained a proviso exempting from the prohibition medical students and pupil midwives attending as part of their course of training. Fears were expressed while the Bill was under discussion in the House of Commons that under this exemption it might be possible for students and pupil midwives in the early stages of their training to undertake the delivery of women and the Secretary of State for Scotland promised

to look into the question whether there was any possibility that this might occur. He accordingly arranged a conference between the Department of Health and representatives of the university medical schools and of the maternity hospitals engaged in the training of midwives. The conference was held on April 23. The representatives of the training bodies assured the Department that the fears which had been expressed were groundless. As regarded medical students they pointed out that the effect of the recommendations of the General Medical Council was that no student could undertake any practical midwifery work until the latter part of the fourth year of his curriculum and before undertaking any domiciliary case he must have had adequate theoretical and practical instruction in midwifery including the witnessing of demonstrations and the delivery of women under qualified supervision in a maternity hospital or ward. They assured the Department that the arrangements for training in every Scottish university were such as to ensure the safety of the patients and had been recognized by the General Medical Council as complying with its requirements.

With regard to pupil midwives the rules of the Central Midwives Board for Scotland secured that the pupil before undertaking any domiciliary case should not only have received sufficient theoretical and practical instruction, including demonstrations but should have delivered under qualified supervision five patients in a maternity hospital or institution giving a course of training which had been approved by the Board. No pupil midwife was trained in Scotland otherwise than in accordance with those rules which were subject to the approval of the Department of Health. It was clear therefore that neither medical students nor pupil midwives were sent out to the homes of the people until they had been properly tested out in the maternity ward and had satisfied their teachers that they could be trusted with outside cases.

Lord STRATHCONA welcomed the Bill as a very long step towards a State medical service.

The Bill was read a second time.

In the House of Lords on May 4 the Maternity Services (Scotland) Bill passed through committee without amendment.

Causes of Silicosis

Mr JAMES GRIFFITHS asked on April 29 whether the Secretary for Mines could give information regarding the claim made by the Institute of Mining and Metallurgy that recent researches made by the institute had resulted in discoveries capable of reducing the incidence of silicosis in mines by 90 per cent. Commander SOUTHBY replying for Captain CROOKSHANK said that in a speech on April 22 the President of the Institute pointed out that among certain categories of miners on the Rand the incidence of silicosis in 1935 was 90 per cent. less than in the period 1920 to 1923. This improvement was attributable to preventive measures—for example as regards drilling and shot-firing—which were already applied in the United Kingdom where risk of silicosis was to be apprehended with the exception that in the United Kingdom there was no system of initial or periodical medical examinations. The President had also made mention of recent developments in research into methods of collecting and examining samples of dust from the air. This was not suggested to be a case of cause and effect and the researches had not yet reached the stage of providing further preventive measures of practical application.

On May 4 Captain CROOKSHANK replying to Mr J. Griffiths said that the South African regulations with regard to silicosis applied only to the scheduled mines which generally were the metalliferous and not the coal mines. As at present advised he did not propose as regards the coal mines of this country to displace the method of differentiating requirements according to risk in favour of applying the same requirements to all these mines. The whole matter was however under consideration by the Royal Commission now sitting.

Training of Blind Persons

Sir KINGSLEY WOOD told Sir WM JENKINS on April 29 that the test for the certification of blindness in England and

Wales was that the person was so blind as to be unable to perform any work for which eyesight was essential. There was substantial uniformity in applying this test in accordance with criteria set out in a circular.

On the same date Mr OLIVER STANLEY told Sir Wm Jenkins that the number of blind boys and girls as distinct from the partially sighted who left the schools for the blind each year at the age of 16 was about 200. Practically all likely to be employable entered vocational courses of training. On March 31 1936 the total number of boys and girls from schools for the blind who were being trained was 698. The Board of Education had no record of border line cases of pupils in schools for the blind but he agreed with the conclusion of the Committee on Partially Sighted Children that such children should be taught in schools or classes for partially sighted children and that hardship was involved if they were educated and brought up as blind and had later to enter the sighted world for which their education had not fitted them.

Midwives Act and Maternity Benefit

On May 3 Mr Dr ROBINSON asked the Minister of Health whether he would introduce legislation to amend the National Health Insurance Acts so as to increase the amount of maternity benefit payable by approved societies seeing that the Midwives Act 1936 by making compulsory the attendance of a qualified midwife at all confinements threw an added financial burden on insured contributors at such times. Mr R S HENSON said that the position of a woman entitled to maternity benefit as regards the arrangements for attendance at her confinement was not materially affected by the provisions of the Midwives Act 1936. The National Health Insurance Acts had always contemplated that such a woman should be attended either by a medical practitioner or a qualified midwife. The Midwives Act expressly provided that the fees charged by local authorities for the services of their midwives might be remitted in whole or in part where the circumstances justified such remission. The Minister of Health did not therefore consider that the coming into operation of the new Midwives Act afforded any reason for the suggested amendment of the National Health Insurance Act.

Maternal Mortality—On May 4 Mr R S HENSON replying to Mr G Griffiths said that for 1936 the deaths classified to pregnancy and childbearing in England and Wales were 2,302 while the deaths not classified to those causes but returned as associated therewith were 677. These figures were provisional.

In our advertisement columns this week the London County Council invites applications for the appointment of a coroner for the County of London at a salary of £1,700 per annum.

The Rt Hon Arthur Greenwood M.P. will perform the opening ceremony of the Metropolitan Borough of Hackney's Maternity and Child Welfare Centre at 136 Richmond Road Hackney, to-day (Saturday May 8) at 4 p.m.

We are asked to announce that the May meeting of the South West London Medical Society (originally fixed for May 12) will be held at the Bolingbroke Hospital, Wandsworth Common S.W. on Wednesday May 19 at 9 p.m. when Dr Wilfred Sheldon will speak on 'Abdominal Distension in Children'.

The Court of Inquiry appointed by the Minister of Labour to investigate and report on the issues involved in the London omnibus strike has been meeting daily this week at the Middlesex Guildhall. On Monday Dr James Woodhall chief medical officer at Manor House Hospital, N.W., was called by Mr Bevin on behalf of the men and gave evidence regarding complaints of irregularity of meals and irregular hours of work, the constant vibration of buses fumes from motor engines and the increased nervous tension attributable to the speeding up of services. Dr H B W Morgan medical officer to the Trades Union Congress referred to the number of complaints of gastric symptoms etc. received from men in transport work and classified these into digestive symptoms and neuro-muscular symptoms. He shared Dr Woodhall's impression that there was a higher incidence of gastric trouble among omnibus drivers and conductors than among other classes of workers. On Tuesday Dr Millais Culpin professor of medical industrial psychology at the London School of Hygiene and Tropical Medicine gave evidence regarding his examination of a number of bus drivers at the Manor House Hospital diagnosed as suffering from gastric disturbances. He agreed with Mr Bevin that his preliminary studies led him to the view that there was at least a strong *prima facie* case for a thorough investigation into the effects upon the nervous system of speed vibration fumes and inspection.

Queen Mary has appointed Mr C B Goulden O.B.E., F.R.C.S. as Surgeon Oculist and Mr Francis Donovan C.V.O. L.D.S. R.C.S. as Surgeon Dentist to Her Majesty's Household.

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR BRITISH MEDICAL JOURNAL B.M.A. HOUSE TAVISTOCK SQUARE W.C.1

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication.

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager British Medical Association House Tavistock Square W.C.1 on receipt of proofs. Authors overseas should indicate on MSS if reprints are required as proofs are not sent abroad.

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager.

The TELEPHONE NUMBER of the British Medical Association and the *British Medical Journal* is EUSTON 2111.

The TELEGRAPHIC ADDRESSES are
EDITOR OF THE *BRITISH MEDICAL JOURNAL* *Antilog*

The address of the B.M.A. Scottish Office is 7 Drumshough Gardens Edinburgh (telegrams *Associate Edinburgh* telephone 24361 Edinburgh), and of the Office of the Irish Free State Medical Union (I.M.A. and B.M.A.) 18 Kildare Street Dublin (telegrams *Bacillus Dublin* telephone 62550 Dublin).

QUERIES AND ANSWERS

Motoring Queries

"MEDICAL MOTORIST (St Helens) writes I would be grateful for formulae of the following from my fellow medical motorists (a) an effective corrosion inhibitor for the radiator and (b) a reliable anti freeze solution with the amount to be added

Income Tax

Partnership—Separate Allowances

PERPLEXED inquires in what way he should approach the authorities so that he can claim his allowances without the necessity of their becoming known to his partners

•• The income tax in the case of a partnership is assessable on the firm as such and as the allowances must be shown on the firm's assessment notice it follows that to the extent to which the allowances are claimed on the form of return they will become known by inference to the other partners. We suggest that as regards any particular allowances which

Perplexed wishes to remain unknown to his partners he should omit them from his declaration for assessment pay the additional tax and claim it back as a separate matter. It might avoid misunderstanding if he took an opportunity of explaining what he proposes to do and his reasons for doing it, to his local inspector of taxes.

LETTERS, NOTES, ETC

Minnitt's Apparatus

Dr O DONEL BROWNE (Dublin) writes Although the "Queen Charlotte's" gas air apparatus is already well known to many practitioners elsewhere I hope it will soon be available for more general use in this country. It is unquestionably one of the most outstanding advances in present-day obstetrics being excellent for maternity practice whether in the private house or nursing home. My experience with this apparatus has been most satisfactory and completely agrees with the several reports issued to date. The patients themselves though possibly mistrustful of the apparatus at first sight now feel they cannot recommend it too enthusiastically. Whether used by itself alone or in conjunction with twilight sleep the results have been excellent, and I have had no anxiety for any mother or child following its use. I sincerely hope that the rate of production of this apparatus will be accelerated in the near future and that this means of relieving the pains of labour will soon be available for and accepted by all doctors and nurses, both for their nursing home and private house maternity practices. I heartily congratulate the doctors and manufacturers on their enterprise and achievement.

Short wave Therapy

Dr H J TAYLOR writes from the St. John Clinic and Institute of Physical Medicine London SW1 May 1 draw the attention of your readers who are interested in short wave therapy to the following quotation from a report recently issued by the American Council of Physical Therapy a body which should certainly have its counterpart in this country.

Much of the work of the council in the past year has been confined to the consideration of so called short wave diathermy machines. In view of the deliberations the council believed it was justifiable to state, based on the present available evidence the following conclusions (1) there is no specific biologic action of high frequency currents (2) there is no specific bactericidal action (3) the therapeutic effect is due to the heat produced. Elaborating these three conclusions, the council felt that the general practitioner should understand that when he buys a short wave diathermy machine he is simply purchasing an apparatus capable of producing heat. In the light of available evidence it has absolutely no other specific action."

The Red Cross in Spain

The International Committee of the Red Cross reports that its appeal for funds and for gifts in kind for the relief of the victims of the civil war in Spain continues to meet with response from Red Cross societies in all parts of the world but that considerably larger sums are required to meet the appalling needs. There is a gratifying recognition of the impartiality and prestige of the Red Cross by both parties to the conflict and this has enabled its representatives to carry into effect many schemes for the relief of suffering. The committee continues to pay special attention to the question of help to prisoners. This work more than any other depends on the good will of the respective authorities but visits to prisons by Red Cross representatives are now permitted in many localities and standardized parcels of food and clothing are distributed. Prison hospitals have been established and in some cases the exchange of prisoners has been effected. One valuable aspect of the work has been the organization of intercommunication between the various members of families separated by the exigencies of the war. Standardized post cards, approved by the censors of both parties have been instituted and consent obtained for their dispatch and distribution through local Red Cross bureaux.

The Veterinary Curriculum

Mr M HARVEY CLARKE M.R.C.V.S. writes In an interesting article in the *Journal* of April 10, under the heading Veterinary Education it is stated that it appears that at some future time it will be necessary to extend the course of the veterinary curriculum from four to five years. May I point out that the course of the veterinary curriculum is five years, and has been so for some time but it has recently been suggested that it may be necessary at some future time to extend this course from five to six years.

Air Raid Precautions Instruction in Wandsworth

Dr H B DODWELL (Hon Sec Wandsworth Division of the B.M.A. 57 Albert Bridge Road SW11) writes May 1 remind those readers living in the boroughs of Wandsworth or Battersea who have not yet attended air raid precautions (anti gas) classes that there will be two more courses, beginning on Friday May 21 either afternoon or evening. If they wish to attend will they kindly get in touch with me.

Coronation Maps for Motorists

A map of London showing the "Coronation areas" and the roads leading to or avoiding them has been issued by the Automobile Association. On one side the map shows an area within twenty five miles of the "Processional Route" and all important approach or "ring" roads. The position of all A.A. roadside telephone boxes is marked especially those which will be manned by patrols from May 10 and equipped with copies of this and other maps and leaflets showing garages near railway stations on the outskirts of London. On the reverse side a large scale street map of Central London shows the Royal Procession route the Coronation area which will be closed to ordinary traffic and the roads affected by police regulations. An inset map also gives particulars of the traffic regulations in force when floodlighting takes place from May 12 to 17 inclusive. Members of the Automobile Association may obtain copies of the map free of charge from any A.A. office.

Austin Flint's Murmur

H. FLEISCHHAUSER (*Munch med W'chr*, March 12, 1937, p. 409) draws attention to the presystolic or diastolic murmur at the apex in cases of aortic insufficiency first described by Flint in 1860. It is due to (1) a throwing back of the segments of the mitral valve producing a resistance to the inflow of blood from the left atrium—that is a mitral stenosis exists without anatomical changes in the valve segments or (2) the murmur is due to a swinging of the valve segments resulting from a meeting of the blood stream returning from the aorta and that flowing in from the left atrium. The differential diagnosis between an organic and a 'functional' Flint's murmur is often very difficult. The author describes a case of subacute endocarditis examined post mortem. Yellowish masses of the size of a lentil were found on the three segments of the aortic valve. On the anterior segment of the mitral valve an aneurysm was present which gave rise to a stenosis of the venous ostium. Fleischhauser believes that the aneurysm was due to pressure of the blood flowing back from the aorta and that it gave rise to the presystolic murmur noted during life. He is of the opinion that Flint's murmur is more often due to a swinging of the mitral valve segments following a meeting of two blood streams than to a functional stenosis of the valve such as occurred in this case.

357 Anaemic Crises in Haemolytic Jaundice

H. G. DIDIKSEN (*Norsk Mag Lægevidensk*, March 1937, p. 279) gives an account of two Norwegian families several of whose members erected an epidemiological sensation. In one of these families there were eight cases of an acute febrile disease in February and March 1934. Profound icterus, enlargement of the spleen and great general debility were accompanied in several cases by loss of consciousness. Two of the patients died after an illness of only a few days. In another family in a neighbouring parish four similar cases had been observed a few months earlier. The nature of the disease being obscure two of the patients were admitted to hospital in Oslo for observation. Though they were no longer febrile they still suffered from icterus and enlargement of the spleen. In both cases familial haemolytic jaundice was diagnosed. A little later two members of the other family were admitted to hospital and they too proved to be suffering from familial haemolytic jaundice. Further investigations showed that altogether eighteen members of these two families suffered from familial haemolytic jaundice. It is probable that the two families were overtaken by some acute infectious disease such as influenza and that their reaction to it with acute anaemia and various other manifestations was largely determined by their basal disease—the familial haemolytic jaundice which under normal conditions runs a comparatively mild course. The author suggests that the acute manifestations precipitated by what was presumably an attack of influenza came under the heading *crises haemolytiques* or *crises febriles*.

this method in twenty persons whose electrocardiograms were characteristic of bundle branch block the writers came to the following conclusions: (1) Among seventeen cases with electrocardiograms indicating right bundle branch block fifteen clearly showed that the right ventricle contracted first thereby indicating a left bundle branch block. In the other two cases no signs of ventricular asynchronism could be discovered. (2) Of three cases with electrocardiograms characteristic according to Wilson and others of a right bundle branch block in one the left ventricle contracted before the right, while in the two others no asynchronism was detected. (3) The electrocardiogram by itself therefore is not a reliable means of diagnosing complete bundle branch block with its mechanical consequences.

359

Acetanilide Poisoning

E. LUNDSTEEN, E. MEULENGRACHT and A. RISCHTEL (*Ugeskr Laeg*, February 11 1937, p. 155) draw attention to the frequency with which acetanilide enters into the composition of 'headache powders' whose sale in Denmark is comparatively unhampered by legal restrictions. In the course of the past five or six years they have observed ten patients suffering from obvious chronic acetanilide poisoning the dosage of this drug ranging from 0.3 gramme to 4.5 grammes daily. In some cases the drug had been taken for relief of headache for ten to fifteen years. The condition which drew attention to this chronic poisoning was a characteristic cyanosis of the face lips and tongue. It was mainly due to para-imido-phenol derivatives. What was remarkable was the way in which the patients clung to their 'headache powders' for which they could find no satisfactory substitutes in other anti-neuralgic drugs. Acetanilide must be considered as a drug of addiction which creates a definite craving. It is therefore incorrect to consider the disfiguring cyanosis as the most important consequence of chronic acetanilide poisoning. It also induces emaciation and anaemia. But what the authors consider as most important is the vicious circle started by acetanilide medication. The indications for this drug are usually headache and lassitude both of which are temporarily relieved but in the long run aggravated by it. The authors therefore recommend changes in the regulations governing the sale of this drug in Denmark. At present a medical prescription containing this drug may be presented to a chemist as often as the holder likes within five years of its signature.

Surgery

Bilateral Urinary Calculi

K. TZSCHIRNITSCH (*Z Urol*, Bd 31, Heft 3, 1937, p. 20) takes a gloomy view of the prognosis and treatment of bilateral urinary calculi which according to him are present in 20 to 25 per cent of all cases. Operation is only indicated if (1) it is possible to leave the kidney intact, (2) danger to the patient's life can thereby be averted, (3) pain is so acute that life becomes unbearable. Pyelotomy is the operation of choice, nephrostomy is to be preferred to nephrectomy. The consensus of opinion with regard to operation on both sides at once or one at a time is slightly in favour of the latter practice. The time interval between the two operations varies between ten days and four months. There is no consensus of opinion as to whether the better or worse side should be operated on first. In nine cases of his own the author recorded a cure of the calculi after operation on all of them. Urinary calculi are more prone to recur than other calculi. He gives 11 cases from which twenty-five cases had even recurred.

of which two required a third operation. Calculi are found after operation (a) because they were not seen in the radiographs and were not removed at the time (b) because of the persistence of infection, (c) because slackness of the pelvis of the kidney leads to retention of urine and (d) because of lack of vitamin A in the diet. The excretion of urinary colloids is held to prevent recurrence of stones. A vegetable diet disturbs the protective element of colloids, a protein diet enhances it. The administration of chondroitin sulphuric acid is the best-known therapeutic agent for the prevention of stone formation. Tzschirntsch advocates greater attention to the indications for operation and research into other methods of treatment for the prevention and recurrence of stone formation.

361 Buccal Cancer and the Salivary Glands

V MAGRI (*Polichinico Sez Prat*, March 15, 1937, p 515) made a systematic examination of the salivary glands in fifty cases of buccal cancer at the Institute of Morbid Anatomy at Venice. He found that involvement of these glands was very uncommon, only three examples of the kind being noted. When the salivary glands were involved the new growth developed not as the result of metastases but by direct spread of the tumour.

352 Haematoma of the Rectus Muscle in Women

F NORGGAARD (*Hospitalstidende* March 2, 1937, p 246) contrasts the comparatively common haematoma of the rectus abdominis due to severe strains or infectious diseases with the rare spontaneous haematoma in the same muscle. He records as many as four new cases. As in earlier publications on the subject all the patients were women, one of whom had always bruised readily. Her capillary resistance as determined by Göthlin's instrument, was found to be reduced. The predisposing cause of a spontaneous haematoma in the rectus abdominis seems to be one or several pregnancies while the direct cause is a lesion of either a muscle or a blood vessel. In some cases rupture of a muscle has been found at operation, and in others the fibres of the rectus have been separated from each other by a haematoma. It is therefore probable that both processes may play a part. Only one of the seventy-two cases previously on record was that of a nullipara and as many as eleven cases occurred at the time of pregnancy. In fifty-seven cases a cough or some sudden but slight movement was held responsible for the accident. The clinical picture is usually misinterpreted and though practically all the seventy-two patients came to operation, rupture or haematoma of the rectus abdominis was diagnosed beforehand only in eleven cases. The mistaken diagnoses were tumour of the ovary in seventeen cases and various forms of the acute abdomen in the remainder. If the haematoma is fairly large, operative treatment is preferable to conservative treatment, and the prognosis is good.

Therapeutics

363 Russell's Viper Venom

J B HANCE (*Indian med Gaz* February, 1937, p 76) records three cases in which bleeding was controlled by preparations of Russell's viper venom. In the first case there was a direct application of a 1 in 10,000 solution of stypven on cotton swabs to the site of a haemorrhage following tonsillectomy in a male of 48 years, in whom the coagulation time was known to be six minutes. The oozing stopped at once, permitting suture of the faucial pillars over a dry tonsillar bed. In the second case two intravenous injections of 0.5 c cm of 1 in 100,000 solution were employed as a desperate and heroic measure to clear post-operative haemorrhage in a female of 36 years following hysterectomy for menorrhagia. She had had seven-

teen previous severe confinements and was grossly undernourished, but assisted by a direct arm-to-arm transfusion she made an uninterrupted recovery. Intradermal injections were used in the third case that of a male aged 68 known to be a 'bleeder', and complaining of severe biliary colic. His clotting time was reduced from 9 minutes 20 seconds to 6 minutes 30 seconds by the administration of calcium and haemoplastin and half an hour before operation 0.5 c cm of a 1 in 10,000 solution of stypven was injected intradermally. A difficult cholecystectomy was performed, and as the subcutaneous tissues were observed to ooze a further intradermal injection was given. Although the following morning the coagulation time rose no further visible oozing took place. Colonel Hance therefore although aware of the danger of deduction from isolated cases feels that there is a definite wide field of application for Russell's viper venom, and hopes that these cases will induce other observers to confirm his results.

364 Psychopathology of Prolonged Narcotic Sleep

V A GILYAROVSKY (*Arch Sci biol* 1936, vol 42, p 89) considers lengthy narcotic sleep to be the only method of curing schizophrenia. He was able to show that a lengthy narcotic sleep brings about a typical intoxication which is in some cases responsible for a peculiar hallucinatory condition, as well as for a condition of euphoria. During this sleep deep changes observed in the entire organism were manifested by disorders of the vegetative nervous system and also by symptoms resembling those observed in epidemic encephalitis.

Radiology

365 Pitressin in Radiography

J C KENNING and J E LOFSTROM (*Amer J Roentgen* January 1937, p 28) report on the use of pitressin for the elimination of intestinal gas shadows in 1,000 cases. Gas in the intestines often obscures delicate structures on the radiograph, and may even lead to faulty radiographic interpretation in cholecystography and intravenous and instrumental pyelography. Pitressin helps the elimination of intestinal gases. The maximum degree of response to the injection of pitressin occurs between thirty and forty-five minutes after the injection. The gas shadows reappear in about three hours. The authors have adopted the following routine. An enema is given the night before the examination and again half an hour to an hour before the examination next morning, one hour before 0.5 c cm of pitressin is given intramuscularly and is repeated after half an hour. In stubborn cases as many as six injections of 0.5 c cm may be given at suitable intervals. Some gas still remains in the bowel but the radiographs are much clearer and the hepatic flexure is shortened, being drawn away from the gall-bladder area. Very rarely the patients complained of transitory cramps, giddiness, weakness, cold perspiration or slight nausea following the injections. A glass or two of water given during the injection minimized the complaints. Pitressin should be used very cautiously in cases of cardiac decompensation, high blood pressure, coronary disease and acute complete mechanical intestinal obstruction. Pregnancy has not proved to be a contra-indication.

366 Dangers of Arteriography

E VERSCHUYL (*Nederl Tijdschr Geneesk* March 6, 1937, p 1007) who records two personal cases, states that in spite of the statements made by Reynaldo dos Santos in 1933 and by Leriche in 1935, arteriography is liable to lead to serious complications. These have been recorded chiefly by French writers and may be divided into two groups. The first consists of a livid discoloration of the skin with peculiar violet spots which later become gan-

prenous, as recorded by Lambret, Matthieu, Texeuf, Deplat, and Reboul. The second group consists of gangrene without a transitional stage of discoloration of which examples have been recorded by Leclerc, Moniz, and Reboul. Verschuyl's first case was that of a man aged 70 who was admitted to hospital for violent pain in the left leg which was pale and cold. There was a history of slight attacks of pain in the leg for the last ten years. The aorta was punctured at the level of the third lumbar vertebra and 20 ccm of 35 per cent perabrodil was injected. The arteriograph showed an obstruction of the arteries on the right side below the common iliac artery. Death took place suddenly the following day. At necropsy the pericardial sac was found to be filled with large blood clots owing to rupture of the ascending aorta and there was an extensive retroperitoneal haematoma. No rupture could be observed in the abdominal aorta and Verschuyl attributes the haematoma to puncture of the aorta. The second case was that of a woman aged 28 admitted to hospital for severe pain in the right arm accompanied by cyanosis and swelling. Arteriography was performed by the injection of 20 ccm of perabrodil into the right subclavian artery. Immediately after the injection the patient had a typical epileptic attack, but rapid recovery took place. The arteriograph showed nothing abnormal.

367 Serial Radiographs of the Chest

F. A. POTT, I. W. PAUL, and S. R. BEATTY (*Radiology*, January, 1937, p. 40) have examined radiographically the chests of 2,719 university students who showed a positive Mantoux reaction. Of the cases examined 2.79 per cent showed some adult type of lesion while 21 per cent presented evidence of previous early infection or some infantile type of tuberculosis. Radiographic films were taken in every case; small lesions may be overlooked at a fluoroscopic examination. The work of carrying out the examination was organized in such a way that only forty-five seconds were required for each examination and one hundred patients could be examined in about an hour. In spite of this speed a second examination was necessary in only 3 per cent of cases. The authors describe in detail the technical organizations for the carrying out of the work.

368 Radium Therapy of Uterine Fibroids

R. GASTROUMAU (*J. Radiol. Electrol.*, January, 1937, p. 1) considers x-ray therapy to be the treatment of choice of uterine fibroids. However, in a limited number of cases it may be advantageous to use radium therapy instead. Radium therapy is indicated in cases where transportation of the patient presents difficulties or where patients are very anxious to get through the treatment in the shortest possible time. The results of such therapy are probably just as good as those of x-ray therapy, but radium therapy presents certain dangers such as septic uterine complications, phlebitis, and pelvic peritonitis. The author had one fatal complication among twenty-nine cases treated with radium, but over a number of years no complications have followed x-ray therapy.

irradiation treatment alone is applied high filtration—at least 2 mm of copper—should be used and treatments given every day for sixty to seventy days through small fields until a total dose of 12,000 r units is reached. These large doses are certain to result in an x-ray pleuro-pneumonitis, but this should not deter the radiologist from giving an adequate dose.

370 Radium Therapy of Mediastinal Tumours

M. JOLY (*Paris med.*, February 6, 1937, p. 131) discusses the different types of mediastinal tumours and their treatment by x-rays. The most common mediastinal tumours are lymphosarcomata. They grow rapidly and soon invade the lungs and they may also invade the pleura and pericardium. They may cause compression of the aorta, the large veins, or of the recurrent laryngeal vagus or phrenic nerves. These tumours are very radio-sensitive. The author advises four fields for irradiation—namely, an anterior, two lateral and a posterior field. He recommends the use of a deep therapy of 180 to 200 kilovolts filtered through 0.5 mm of copper with 1 mm of aluminium and large fields of about 15 by 15 cm. Wherever possible the first treatment should aim at the administration of 750 r to the tumour itself at the first sittings. This, however, may give rise to a severe reaction. In cases with considerable dyspnoea it is therefore preferable to start the treatment with 625 r applied to the anterior field. If no severe reaction follows, further doses of 625 r may be given daily to successive fields until each field has had a total of 3,500 r. In resistant cases the filtration may be increased to 1 mm of copper and the total dose for each field to 4,500 r. Diuretics, laxatives, and daily warm baths are useful during the course of treatment.

371 Encephalography in Epilepsy

F. LAURENTIAU (*Med. Welt*, February 27, 1937, p. 267) has investigated 285 cases of epilepsy by means of encephalography. Fifty of these cases definitely belonged to the category of hereditary epilepsy, while in another twenty-six cases the diagnosis of hereditary epilepsy was probable. Marked encephalographic changes were found in a large number of cases of hereditary epilepsy. The most common changes were unilateral or bilateral enlargement of the lateral ventricles, enlargement of the third ventricle or else non-filling of the ventricles or enlargement, unevenness or mottling of the subarachnoid spaces, but the author never observed in hereditary epilepsy a hydrocephalic ventricular enlargement or a displacement of the ventricles or filling defects or excavations in the ventricular outline. In doubtful cases circumscribed changes in the subarachnoid filling pointed towards a local pathological condition. There was no definite relation between the gravity and the duration of the epilepsy and the encephalographic changes. Pathological changes in the cerebrospinal fluid were found mainly in cases showing ventricular enlargement. The encephalography proved perfectly harmless in 450 cases investigated.

372 Diagnosis of Perinephritic Abscess

Obstetrics and Gynaecology

373 Labour in Elderly Primiparae

J LIMPACH (*Gynécologie* January, 1937, p 24) advises the admission of elderly primiparae to hospital at presumed term and confirms the general opinion that the prognosis for their gestation and labour is somewhat unfavourable. His conclusions are based on the records of 712 primiparae aged 30 to 34 and 223 aged 35 to 45 delivered at the Strasbourg Maternity Hospital. Although pelvic abnormalities were rare (2.1 per cent only) anatomical and functional rigidity of the soft parts, especially of the cervix, gave an increased incidence of dystocia and interventions—forceps, version, incision of the cervix, or perforation being necessary in the 30–40 and 35–45 groups in 13.9 and 19.7 per cent of cases respectively. These groups had 1.8 and 4 per cent of Caesarean sections as compared with 1.5 in younger primiparae. The duration of delivery was not increased, being less than twelve hours in 76 and 69 per cent of the respective age groups. Premature labour was notably frequent—over 11.5 per cent. The foetal mortality (3.7 is the average for the country) was 5.2 per cent in the younger and 11 per cent in the older age groups. There were only four maternal deaths in 935 cases. Cases of toxæmia were very few, probably owing to strict supervision being possible—this consisted of six cases of eclampsia, one of pregnancy dermatosis, and five of hyperemesis. Renal complications on the other hand—albuminuria, oedema, and increased blood pressure—occurred frequently, namely in 5.8 per cent of cases.

374 Urethral Disease

ARTHUR H PAINE (*NY St J Med* December 1, 1936, p 1827) discusses the present state of knowledge of female urethral disease. He points out that whereas urinary disease in the male has been accorded intensive study owing to its obstructive nature and danger to life, disorders of the female lower urinary tract have been largely ignored. The evolution of the cystoscope from the right-angled to the more oblique lens and the use of the open cystoscope have clarified the anatomy of the bladder neck, disclosing a definite angulation with anterior curvature at the urethral upper third. At the meatus and anterior two thirds the following pathological changes may occur: (1) congenital stenosis (2) stricture congenital or inflammatory (3) hyperplasia and extrusion of inflamed mucosa; (4) caruncle which may be a granuloma from chronic urethritis, a papillary angioma or a mucoid polyp (5) suburethral abscess (6) carcinoma. Diagnosis should be based upon close inspection of the fourchette, manual palpation of the urethra through the anterior vaginal wall, microscopical examination of Skene's and Bartholin's gland contents, and catheterization, urethroscopy and cystoscopy. Uterine disease and diabetic conditions should be excluded. Relief of all types of stricture is frequently experienced by mechanical dilatation of the urethra. A caruncle can be excised, cauterized or treated with radium seeds. Urethro-trigonitis will respond to alkalis and sedatives, suburethral abscess or calculi to incision and drainage or extraction through the anterior vaginal wall. By these means Paine considers the casual diagnosis of pyelitis is avoided and much minor misery alleviated.

375 Honey for Pruritus Vulvae

According to F SCHULTZE RHONHOFF (*Zbl Gynäk* March 13, 1937, p 610) there is a large group of cases of pruritus vulvae which are of obscure causation and in which the most varied lines of treatment prove useless or only transiently successful. In general, irradiation by x rays and the administration in quick succession of massive doses of ovarian hormone are the most helpful lines of treatment. Schultze Rhonhoff and his pupils

however have recently had excellent results in refractory cases from local applications of honey every evening. The treatment is empirical, for little evidence is forthcoming that honey contains significant amounts of vitamins or hormones.

Pathology

376 Sedimentation Rates in Tuberculosis

S FLORELIUS (*Tidsskr norske Lægeforen* March 15, 1937, p 313) gives an account of the various tests employed in 1935 by the Norwegian Army authorities for the elimination of the tuberculous from among recruits. All of them were tested with Pirquet's reaction, and the positive reactors were examined by the sedimentation test. All whose rate of sedimentation was above normal were given a radiological examination. Among 3,392 Pirquet positive recruits were 248 whose rate of sedimentation was above normal. In as many as 130, or about 53 per cent of the 248, the radiologically demonstrable changes in the lungs were so definitely indicative or suggestive of tuberculosis that the men were discharged. Of the 3,144 Pirquet positive recruits with a normal rate of sedimentation only thirty-four or 1.08 per cent were discharged. The percentage of Pirquet positive recruits was lowest in and about Oslo and highest in the extreme north of Norway, where 47 per cent of those examined proved to be positive reactors. In the Guards regiment representing an army élite, only 25.9 per cent of the recruits were Pirquet-positive. In 1924 Pirquet testing of this regiment showed 57 per cent to be positive reactors. In those units in which the Pirquet tests were carried out both at the beginning and at the end of military service very little change was found in the proportion of positive and negative reactors, an observation suggesting that there had been very little infection in the course of military service.

377 Regional Differences in Leucocyte Counts

M GÄNSSLEN (*Disch med Wschr* March 26, 1937, p 505) found that while he worked in Tübingen the leucocyte counts of healthy patients conformed to text book standards. But soon after he moved to Frankfurt he noticed certain inexplicable differences in his leucocyte counts from what he had hitherto considered as normal. These differences concerned not only the total number of leucocytes but also their mutual relationship. According to both Naegeli and Schilling the total leucocyte count is normal between 6,000 and 8,000, and the percentage of lymphocytes is normally between 20 and 25 according to Naegeli and 23 according to Schilling. But in Frankfurt the leucocyte count of 1,084 patients not suffering from any disease of the blood showed an average of only 6,300, the number being below 6,000 in 45 per cent of all the cases. The average percentage of the lymphocytes was 30. To control these observations Professor Gänsslen obtained 500 blood counts from three Frankfurt hospitals other than his own and again it was found that the average leucocyte count was 6,300 and 31.9 per cent of the leucocytes were lymphocytes. Another control observation was an examination of 160 young male adults in towns near Frankfurt. In this series the average leucocyte count was 6,340, and 34.3 per cent of the leucocytes were lymphocytes. After examining the blood of various other groups and obtaining figures similar to those already quoted Professor Gänsslen notes that he and his family, and assistants who moved with him from Tübingen to Frankfurt have undergone profound leucocyte changes since moving from the one town to the other. The percentage of their lymphocytes has approximately doubled and the total number of leucocytes has fallen below 6,000. The conclusion to be drawn from these observations is that certain geographical and climatological factors must have an influence on the leucocyte count, but precisely what these factors are has yet to be discovered.

In the treatment of PERNICIOUS ANÆMIA a 1937 achievement in chemistry

- 1 the purest Liver extract now available
- 2 1/10th its former dry weight
- 3 painless on injection
- 4 monthly dry dosage is now similar to the dry dosage of Insulin required by an average diabetic case over the same period

UNNAS' PASTE TYPE BANDAGE IN TROUBLE-FREE FORM

If it is necessary to apply bandaging for several months, there may be a tendency for the skin to become irritated. In such case, a temporary change to Viscopaste is advised before continuing.

The Viscopaste Bandage is a specially prepared cotton bandage spread with a zinc oxide and gelatin mixture. It is kept moist in a waterproof wrapping and is immediately ready for use.

In the after-treatment of fractures of Femur, Tibia, Fibula, or ankle, the oedema which develops when the patient gets up can and should be controlled by a Viscopaste support.

Write for samples to T. J. Smith & Nephew Ltd.

CHRONIC PSORIASIS

Complete cure after local treatment with Peat Ointment

This letter came to us from a doctor the other week
Dear Sirs

I am very pleased to report that a young married woman patient has been completely cured of a very long standing Chronic Psoriasis by the use of your Sphagnol Ointment.

I consider that this is very remarkable as this patient has been under treatment for years in private and Hospital, and Sphagnol is the only preparation that has brought lasting relief. Her skin to day is as soft and clear as in her early childhood days. Needless to say she is extremely grateful and her recovery has caused a great deal of favourable comment.

Yours very truly
(Signed) M.B., Ch.B., F.R.F.P.S

Though neither dangerous nor painful psoriasis is still a great annoyance. Usually correcting faults of clothing and diet will give relief but sometimes local assistance is necessary. Then regular applications of Sphagnol Ointment which contains the healing principles of peat, will generally clear up the skin in a very short time. If you are not familiar with Sphagnol preparations, please let us send you free samples.

Sphagnol

Peat Products (Sphagnol) Ltd., Dept B 206 21 Bush Lane, London E.C. 4

A doctor with a cold !

It is essential that the doctor should avoid colds, although no one is more exposed to infection. The daily use of Vapex is recommended and practised by many medical men. A drop on the handkerchief lasts all day. Most patients know the pleasant, refreshing odour and like to think that their doctor is taking precautions for their safety as well as his own.

FORMULA

THYMINIC ACID	0.10
Hexamethylenetetramine	0.10
Lysidine	0.10
Uric Acid	0.10
Water	1.00
Total	1.40

DIRECTIONS

One teaspoonful to be taken morning and night in a tumblerful of water

Uralysol, in addition to being a solvent and eliminator of pathological Uric Acid is a powerful urinary antiseptic.

Normally there exists in the body a certain quantity of uric acid which assists its general metabolism and after it has played its part is eliminated together with the normal thyminic acid of the organism. When however uric acid is present in excess the body needs additional thyminic acid to supplement the resultant deficit of this normal solvent of uric acid.

Uralysol, by its thyminic acid content supplies the agent necessary to dissolve excessive uric acid.

The next step is the elimination of this thyminic uric acid which being in excess of normal necessitates treatment by an agent capable of enhancing elimination.

Uralysol, by its content of hexamethylenetetramine and lysidine stimulates the organism to eliminate the pathological uric acid already dissolved by its thyminic acid content.

Comparative Vitamin 'B' Content in Bread

The question as to what form of bread provides most completely and economically the essential Vitamin 'B' has now been settled by independent experiments

It has been shown that HOVIS by reason of its high wheat-germ content, is richer than either white bread or wholemeal in this vital food-element. This is due to the fact that 25% of the flour from which HOVIS is produced consists of wheat-germ—the source of Vitamin 'B'. The great value of HOVIS is that it contains all the elements of a complete food and is easily absorbed. Furthermore, the low starch content renders it very digestible especially for convalescents and those whose vitality is low

*A BOLSTER that becomes
an Invalid Bed Cushion in
a second!*

The Dunlopillo Adjustable Bed Cushion is invaluable to invalids and convalescents. In a second it can be converted from a bolster to a back rest, head rest or leg rest, providing an ideal support. It avoids using extra pillows, which are not really comfortable, and enables the patient to recline or sit up in bed in luxurious comfort. The soft resilience of the Dunlopillo Bed Cushion never needs pinning up; it always keeps its shape. It is porous, self-ventilating, moth proof, dustless, and completely hygienic.

ST. ANDREW'S HOSPITAL

FOR MENTAL DISORDERS

NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY

President THE MOST HON THE MARQUESS OF EXETER C.M.G. A.D.C.

Medical Superintendent DANIEL F. RAMBAUT M.A. M.D.

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients who are suffering from incipient mental disorders or who wish to prevent recurrent attacks of mental trouble, temporary patients and certified patients of both sexes are received for treatment. Careful clinical, biochemical, bacteriological and pathological examinations. Private rooms with special nurses male or female in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE

This is a Reception Hospital in detached grounds with a separate entrance to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical bath, Plombières treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray room, an Ultra Violet Apparatus and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological, and pathological research.

MOULTON PARK

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 640 acres. Milk, meat, fruit and vegetables are supplied to the Hospital from the farm gardens and orchards of Moulton Park. Occupation Therapy is a feature of this branch and patients are given every facility for occupying themselves in farming, gardening and fruit growing.

BRYN-Y-NEUADD HALL

The seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres. Llanfairfechan amidst the finest scenery in North Wales. On the North West side of the Estate a mile of sea coast forms the boundary. Patients may visit this Branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout-fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses and bowling greens. Ladies and gentlemen have their own gardens and facilities are provided for handicrafts such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 2356 and 2357 Northampton) who can be seen in London by appointment.

NORTHUMBERLAND HOUSE,

GREEN LANES, FINSBURY PARK, N 4

COUNTY BOROUGH OF HUDDERSFIELD

ASSISTANT SCHOOL MEDICAL OFFICER

Applications are invited for the above post, in which a good knowledge of diseases of children and experience in bacteriology are essential.

Salary according to scale—£500 per annum increasing to £700. The commencing salary will be based on the candidate's previous experience.

The post is designated under the Superannuation Act, 1922, and the appointment therefore is subject to a satisfactory medical examination.

Applications stating age and giving full particulars regarding training qualifications and appointments held since qualification should be forwarded to the Medical Officer of Health along with copies of two recent testimonials so as to reach him not later than Thursday May 20th 1937.

UNIVERSITY COLLEGE HOSPITAL

Gower Street W.C.1

Applications are invited for the post of HONORARY PHYSICIAN in charge of the DEPARTMENT OF PHYSIOTHERAPY at 100, October 1st, 1937, and should reach the Secretary by first post on Thursday May 14th 1937.

ROYAL NAVAL MEDICAL SERVICE.

A number of vacancies exist for Medical Officers in the Royal Navy, and applications are invited for entry in July, 1937

Candidates must not be above the age of 28 years and must be registered under the Medical Acts. No examination in professional subjects will be held, but candidates will be required to attend for interview by a Selection Board

Selected candidates will be entered for Service for a period of three years in the first instance, which may be extended to five years at the discretion of the Admiralty

At the end of three years' service officers may retire with a gratuity of £400, but those who serve for five years will receive £1,000

At the end of five years' Short Service permanent commissions will be given to selected officers who wish to make the Naval Medical Service their permanent career

Opportunities are available for officers on the permanent list to specialise, and ample provision is made for Post Graduate Study

Copies of the regulations for entry and conditions of Service, including rates of pay and allowances, may be obtained from the Medical Director General of the Navy, Admiralty, S W 1, and from the Deans of all Medical Schools

Applications for entry from intending candidates must be received not later than May 31st, 1937

COUNTY COUNCIL OF MIDDESEX HILLINGDON COUNTY HOSPITAL, LADBROKE

JUNIOR RESIDENT ASSISTANT MEDICAL OFFICER

Applications are invited for the above appointment. Salary £1,000 per annum (together with board lodging and laundry). Candidates must be registered medical practitioners who have held resident appointments in a general hospital. Experience in an obstetric is desirable.

The officer appointed will be required to work under the control of the Medical Superintendent and to devote his whole time to his official duties.

The appointment will be subject to medical examination. It is for a period of six months in the first instance, and may be extended for an additional six months, and is subject to one month's notice either side. At the expiration of one year's service the officer appointed will leave the Council's service unless promoted to a higher grade. Relationship to any member or officer of the Council must be declared in the application.

Applications, with copies of not more than three recent testimonials, must be received by the undersigned not later than May 15th, 1937. Applications must be accompanied by envelopes for testimonials. Candidates may apply directly or indirectly to the undersigned.

C. W. BALCH, J. Z.

Midsex Guildhall,
Westminster S W 1

COUNTY BOROUGH OF OLDHAM Municipal Hospital RESIDENT ASSISTANT MEDICAL OFFICER

Applications are invited from Registered Medical Practitioners for the post of Resident Assistant Medical Officer.

Salary £200 per annum with board residence and laundry.

Candidates should be unmarried.

The appointment will, in the first instance, be for a period of six months. The successful applicant, however, will be eligible for re-appointment for a further period of six months.

The hospital comprises 375 beds with facilities for gaining experience in medicine, surgery, midwifery and diseases of children.

Application forms may be obtained from the Medical Officer of Health, Town Hall, Oldham, and should be returned endorsed "Resident Assistant Medical Officer" as soon as possible but not later than Monday, May 17th, 1937.

JOSEPH J. WILLIAMS, LL.D.
Town Clerk
Town Hall, Oldham
April 6th 1937

THE ROYAL BOROUGH OF KENSINGTON APPOINTMENT OF DEPUTY MEDICAL OFFICER OF HEALTH

Applications are invited for the post of Deputy Medical Officer of Health. Applicants must possess the qualifications prescribed by the Local Government (Qualifications of Medical Officers and Health Visitors) Regulations, 1930, for a Tuberculosis Officer and must hold the Diploma in Public Health.

The appointment will be a whole-time one, and the successful candidate will be required to act as Clinical Tuberculosis Officer for the Borough and to carry out other duties in the Public Health Department under the direction of the Medical Officer of Health.

Salary £200 per annum, rising by annual increments of £10 to £110 per annum, plus an annual travel allowance of £10.

The age limit for candidates is 45 years.

Candidates who are disqualified by the Local Government (Qualifications of Medical Officers and Health Visitors) Regulations, 1930, must be obtained from the undersigned.

Applications, with copies of not more than three recent testimonials, must be received by the undersigned not later than Monday, May 17th, 1937.

Town Hall, Kensington W 8
April 1st 1937

COUNTY BOROUGH OF OLDHAM EDUCATION COMMITTEE

Applications are invited from qualified and registered medical men for the position of whole-time ASSISTANT SCHOOL MEDICAL OFFICER. Salary £500 per annum, rising by annual increments of £25 to £700 per annum.

The duties of the appointed Officer will be principally connected with the work of the School Medical Department, but the Officer will be called upon to undertake any other duties under the School Medical Officer who is also the Medical Officer of Health.

The applicants must have had three years' experience since qualifying. Any experience in excess of this or similar service under another Authority will be taken into consideration when fixing the commencing salary. The Officer appointed will be required to devote his whole time to the duties, will not be allowed to engage in private practice, and will be required to reside within the County Borough. All fees and emoluments of any kind whatsoever must be handed over to the Corporation.

Forms of application may be obtained from the undersigned and must be returned to this Office immediately.

Candidates strictly prohibited.
Education Officer: W. KERSHAW
Chairman: Director of Education.
April 23rd 1937

WILTSHIRE SUFFOLK COUNTY COUNCIL ASSISTANT COUNTY MEDICAL OFFICER AND ASSISTANT SCHOOL MEDICAL OFFICER

Applications are invited for the above whole-time appointments (men or women) who in addition to the duties of School Medical Officer in the above County, will be required to undertake any other duties under the School Medical Officer who is also the Medical Officer of Health. Applicants must be registered medical practitioners and not exceed 35 years of age. The successful candidate must hold the Diploma in Public Health. Salary £600 per annum, rising by annual increments of £25 to a maximum of £800, plus a travelling allowance. Particulars of appointment and terms of appointment may be obtained from the undersigned, to whom applications must be accompanied by testimonials. Applications must be received not later than May 15th, 1937.

Candidates may apply to the undersigned or to the County Council, 10, St. Edmund's Street, Bath, Somerset.

COUNTY BOROUGH OF WEST HAM**APPOINTMENT OF MEDICAL OFFICER OF HEALTH AND SCHOOL MEDICAL OFFICER**

Applications are invited from qualified medical men holding a Degree in or Diploma of Public Health for the appointment of Medical Officer of Health and School Medical Officer at a salary of £1,500 per annum rising by annual increments of £50 to a maximum of £1,750 per annum inclusive of all fees and emoluments.

Applicants must not be more than 45 years of age (except in respect of applications from persons already in the service of the Council) and be fully qualified to carry out and perform all the duties of Medical Officer of Health and School Medical Officer and appertaining to the medical services of the Council including those as Administrative Officer under the Mental Efficiency Acts, and such other duties as may from time to time be prescribed by the Council.

The appointment will be subject to the approval of the Ministry of Health and the Board of Education and will be terminable on three months' notice on either side. The person appointed will be required to devote his whole time to the duties of the office and to pay over to the Council all moneys received by him in connection with the appointment from whatever source such moneys are received.

The appointment will also be subject to the provisions of the Local Government and Other Officers Superannuation Act, 1922, and to a medical examination as required by the Council for the purposes of that Act and the statutory contributions to the Superannuation Fund under the Act will be deducted from the salary.

Applications on the form provided (which will be forwarded by the undersigned on receipt of a stamped addressed foolscap envelope) must reach me not later than June 1st, 1937.

Canvassing members of the Council is prohibited and will disqualify.

For full particulars apply to
CHARLES E. CRANFIELD
Town Clerk,
West Ham E.15
April 30th 1937

COUNTY BOROUGH OF WEST HAM

Applications are invited by the Council for the post of **SECOND ASSISTANT RESIDENT MEDICAL OFFICER (male)** at Central Home, Union Road, Leytonstone, E.11. Forms of application giving further particulars may be obtained from the Resident Medical Superintendent up to May 2nd 1937.

ANCOATS HOSPITAL, MANCHESTER 4 EAR NOSE AND THROAT DEPARTMENT

HONORARY REGISTRAR required to ASSIST the Honorary Aural Surgeon at the Clinic on Thursday afternoons and to do such other work in the inpatient department as may be delegated to him by the Honorary concerned.

ORTHOPAEDIC REGISTRAR REGISTRAR required to ASSIST the Hon. Orthopaedic Surgeon in the out-patient department clinics on Tuesday afternoons and Thursday mornings. Honorarium £50 per annum.

The above appointments are for twelve months and are renewable on January 1st each year.

Applications from duly qualified Medical Practitioners (together with copies of three recent testimonials) to be forwarded to the undersigned on or before May 19th next from whom further particulars can be obtained on request.

By Order of the Board
HERBERT J. DAFORNE
Gen. Supt. and Secretary

ROYAL BLKSHIRE HOSPITAL, READING (335 Beds)

Applications are invited for the following resident appointments:

ONE CASUALTY OFFICER (male)
ONE HOUSE SURGEON TO THE SPECIAL DEPARTMENTS (Eye Ear Nose and Throat) (male)

Appointments are for six months and candidates must be fully qualified and registered. Remuneration at the rate of £150 per annum with board residence and laundry.

Applications stating age and experience with copies of testimonials to be sent to the undersigned as soon as possible.

H. E. RYAN
Secretary and House Governor

PRESTON HALL SANATORIUM near Maudstone Kent (300 Beds)

ASSISTANT MEDICAL OFFICER (male) to

COUNTY BOROUGH OF BARNSELY ST HELEN MUNICIPAL GENERAL HOSPITAL (150 Beds)

APPOINTMENT OF MEDICAL OFFICER (MALE)

Applications are invited for the above whole time appointment at an inclusive salary of £650 per annum rising by annual increments of £25 to £700 per annum.

The Hospital was appropriated for administration under the Public Health Acts on April 1st, 1936.

The Officer appointed will be on the staff of the Public Health Department and the appointment will be determinable by three months notice on either side. The successful applicant will act also as Medical Officer for the adjacent Institution and for the Municipal Maternity Home, and may be called upon to act in a consultant capacity for the maternity services of the Borough. He will in the first instance be permitted to reside outside the hospital precincts within such reasonable distance as the Council may agree.

Candidates must have held resident appointments. A high medical qualification with obstetrical experience and experience in hospital administration are desirable.

It is contemplated that the hospital will be developed mainly for medical and obstetric cases, and that in the near future there will be made an appointment of Resident Medical Superintendent when the Medical Officer will then be considered for promotion to such appointment.

Applications stating age, qualifications, etc. together with copies of not more than three recent testimonials, must be sent to reach me not later than May 15th 1937 and should be endorsed Medical Officer St Helen Hospital. Canvassing in any form will be a disqualification.

Town Hall, A E GILFILLAN
Barnsley, Town Clerk
April 26th 1937

ESSEX COUNTY COUNCIL LADY ASSISTANT COUNTY MEDICAL OFFICER OF HEALTH

The County Council of the Administrative County of Essex invite applications for the above appointment from duly qualified Registered Medical Practitioners holding a Diploma of Public Health and not over 45 years of age.

The Officer appointed must have had experience as a Medical Officer of an ante-natal clinic.

The salary will be £500 per annum and will rise subject to satisfactory service by annual increments of £5 to £700 per annum and travelling expenses will be allowed.

The appointment will be held by the successful candidate during the pleasure of the Council and will be determinable by the Officer by three months notice in writing.

The person appointed will be required to pass a medical examination and to contribute to the fund established by the County Council under the Local Government and Other Officers Superannuation Act 1922.

The appointment will be subject to the Council's Sick Pay Rules and Regulations, a copy of which will be forwarded on application.

Applications on the prescribed form obtainable from the undersigned accompanied by copies of not more than three testimonials (which will not be returned) should be addressed to me and delivered at the County Hall, Chelmsford, not later than 10 a.m. on MONDAY, May 24th 1937.

County Hall, E. S. HOLCROFT
Chelmsford, Clerk of the County Council.
May 3rd, 1937

TWO ASSISTANT MEDICAL OFFICERS wanted. Fully qualified and registered. To attend three mornings per week each. Salary £100 per annum. The appointments are for twelve months from July 1st. Applications with copies of three testimonials, to be sent to the undersigned on or before May 24th.

JOHN NALL, Secretary

MANCHESTER ROYAL EYE HOSPITAL.

JUNIOR HOUSE SURGEON required. Salary £120 per annum with residence, board, etc. Applications (with copies of testimonials) endorsed "House Surgeon," to be addressed to the Chairman of the Board of Management not later than May 14th, 1937.

H R NORTH
Gen. Supt. and Secretary

EAST SUSSEX COUNTY MENTAL HOSPITAL HELLINGLY SUSSEX.

APPOINTMENT OF SENIOR ASSISTANT MEDICAL OFFICER

Applications are invited for the post of Senior Assistant Medical Officer (registered and qualified) at the above Mental Hospital. Salary £600 per annum (which includes £50 for D.F.M.) together with the usual emoluments of board lodging and washing valued for superannuation purposes at £90 per annum. Arrangements can be made for a married Medical Officer.

Candidates must possess the Diploma in Psychological Medicine, and be interested in PSYCHOTHERAPY. The hospital possesses a well-equipped laboratory and four out-patient clinics are held in voluntary hospitals in East Sussex. The appointment will be subject to the provisions of the Asylums Officers Superannuation Act, 1909 and may be terminated by one calendar month's notice on either side.

Applications with copies of three recent testimonials stating age and full particulars to be sent to the Medical Superintendent not later than May 21st 1937.

ST BARTHOLOMEW'S HOSPITAL ASSISTANT PHYSICIAN and ASSISTANT DIRECTOR TO THE MEDICAL PROFESSORIAL UNIT

Notice is hereby given that a meeting of the Election Committee will be held on Tuesday June 8th 1937 at four o'clock in the afternoon to elect an ASSISTANT PHYSICIAN, which office is held in conjunction with that of ASSISTANT DIRECTOR TO THE MEDICAL PROFESSORIAL UNIT. Candidates must be Fellows or Members of the Royal College of Physicians of London.

Fifty copies of applications and testimonials should be left with the undersigned on or before Saturday, May 29th 1937.

THOMAS HAYES
May 4th 1937 Clerk to the Governors

MILLER GENERAL HOSPITAL, Greenwich Road S.E.10

Applications are invited for the following posts:
TWO HOUSE PHYSICIANS (male) on married salary £100 per annum

WITH SUPPLEMENT AND EPITOME

LONDON
BRITISH MEDICAL ASSOCIATION
TAVISTOCK SQUARE

BRITISH MEDICAL ASSOCIATION 105TH ANNUAL MEETING, BELFAST

1937

The Council believes that many Members and their friends will desire to attend the meeting in Belfast, but is informed that the hotel and lodging accommodation is likely to be taxed to the utmost

To supplement the limited accommodation in a unique and attractive manner, however, arrangements have been made, with the approval of the Council, for provision of hotel accommodation on board

R.M.S. ALMANZORA

15,500 TONS

During the period of the Meeting, the Liner will enter Belfast Lough and be suitably berthed in order that Members may take a full part in the social and scientific meetings arranged during the week. At the close of the Meeting, the R.M.S. ALMANZORA will leave Belfast and, proceeding via the

INNER AND OUTER HEBRIDES, SCAPA FLOW

will cruise in the Norwegian Fjords, visiting Trondhjem, Merok, Hellesylt, Oie and other places of interest and beauty. The Liner will return to Southampton on the 3rd August.

It has now been arranged to effect the booking of Members or their friends for the cruise only commencing July 24th, from Belfast, at 2/3rds of the schedule rate. May we point out that the cruise is available for friends of medical men even if the latter do not participate in the cruise.

SAILING FROM SOUTHAMPTON

Passages may be booked to Belfast only or for the complete cruise which continues after the Meeting to the Norwegian Fjords. Hotel accommodation on board can be reserved whilst the liner is in Belfast Lough. These arrangements have been made by Messrs. Pickfords Travel Service in conjunction with Royal Mail Lines Ltd and Members of the Association who propose to attend the Belfast Meeting are asked to make an early application.

LATENT SYPHILIS AND THE AUTONOMIC NERVOUS SYSTEM

By GRIFFITH EVANS, M A,
DM (Oxon), FRCS, DOMS

This volume is unquestionably a very
important contribution to syphilology. The
reviewer is convinced that if this second
edition is carefully studied by all who are
engaged in medical work a great deal of
unsuspected syphilis will be uncovered, and
with that much human suffering will be
alleviated.—*Medical Officer*

SAUNDERS' BOOKS

ALL NEW and of REAL HELP in PRACTICE

BERENS' EYE DISEASES

By 82 of the WORLD'S LEADING AUTHORITIES. Octavo of 1254 pages with 436 illustrations some in colours. Edited by CONRAD BERENS, M.D. Ophthalmic Surgeon, Pathologist and Director of Research, New York Eye and Ear Infirmary. Cloth 30s net.

"The book is certainly all that is claimed for it. It presents the essentials of ophthalmology to physicians, surgeons, medical students and those entering upon the practice of ophthalmology. The subject matter is presented in a style that makes it eminently readable and so well are the different sections arranged that one easily forgets that it is the work of eighty-two different contributors."
—Irish Journal of Medical Science

SCHUMANN'S OBSTETRICS

By EDWARD A. SCHUMANN, A.B., M.D., F.A.C.S. Professor of Obstetrics, University of Pennsylvania. Octavo of 740 pages with 581 illustrations on 497 figures. Cloth 27s 6d net.

"...an achievement of the first rank. The chapters follow each other in natural sequence and due prominence is given to conditions and diseases generally considered of outstanding importance to the student and practitioner."
—Medical Press and Circular

CLINICAL HEART DISEASE

By SAMUEL A. LEVINE, M.D., F.A.C.P. Assistant Professor of Medicine, Harvard Medical School. Octavo of 470 pages. Cloth 24s net.

"...is an interesting book. The matter is largely drawn from the author's experience, and he frankly states his own point of view and ideas. The book does not follow any special plan. The subjects are chosen and dealt with independently in view of their practical importance. In fact, practical considerations have a first place all through this work. The book may be read with profit."
—British Medical Journal

DISEASES OF INFANTS AND CHILDREN

By J. P. CROZER CRIFTH, M.D., Ph.D. Emeritus Professor of Pediatrics, University of Pennsylvania, and A. GRAFIE MITCHELL, M.D., B.S., Rachford Professor of Pediatrics, College of Medicine, University of Cincinnati. One octavo of 114 pages with 293 illustrations including 18 plates in colours. Cloth 42s net.

"There are few points indeed on which a reviewer can raise issue with the writers, every school of opinion is fairly represented and fairly adjudged. There are wonderful coloured illustrations of such important things as 'acromegaly', 'tuberculosis' and 'Schick tests' stools in various conditions, etc. The subject could not have found better exponents."
—Irish Journal of Medical Science

ENDOCRINOLOGY IN MODERN PRACTICE

By WILLIAM WOLF, M.D., M.S., Ph.D. Octavo of 1016 pages with 253 illustrations. Cloth 42s net.

"The section on diagnosis is constructed on a practical plan with a suggested order of examination and an interpretation of the value of laboratory findings. It could specially call attention to the chapter on bone development. Not many of us can carry in our minds the dates of the appearance of centres of ossification or of epiphyseal junctions. The series of diagrams illustrating such facts form a valuable picture gallery for ready reference."
—British Medical Journal

TEXTBOOK OF SURGERY

By 184 AUTHORITIES. Edited by FREDERICK CHRISTOPHER, M.D., F.A.C.S. Associate Professor of Surgery, Northwestern University. Octavo of 1625 pages with 1349 illustrations on 740 figures. Cloth 42s net.

"The book cannot fail to stimulate all who read it. Students will use it as an aid in their practical work of demonstration of lectures in surgery and surgeons and practitioners will use it to refresh their memory. It contains first-hand testimony from the best of our experts."
—The Lancet

The importance of The Qualitative Adequacy of the Diet

If the diet is unsuitable, the body cannot be properly constructed neither can it function effectively

(Ministry of Health First Report of Advisory Committee on Nutrition 1937 p 6)

The report quoted above stresses the need for ensuring that the whole community is provided with food which is qualitatively adequate. And it is acknowledged that foodstuffs containing vitamins play an important role in the economy of the body. Marmite is a yeast extract

that is exceptionally rich in vitamin B₁ and the B₂ complex. It is prescribed extensively for its positive health promoting properties. Marmite has many uses in preventive and curative medicine and there is ample evidence of the benefit accruing from its regular inclusion in the diet.

WITH

BELZEMA

BRAND OINTMENT

ILLUSTRATED BY AUTHENTIC CLINICAL REPORTS

"I have been using Belzema Ointment for some time on my infantile Eczemas with most gratifying results."

★ ★
Belzema Ointments seemed to do the trick without the need of unsightly bandaging of my hands and smearing them up with greasy dirty applications.

"The free sample has worked wonders with one stubborn case of Eczema."

★ ★
Am securing most remarkable results from use of your Belzema Ointment and Soap in 3 cases Psoriasis (not having a duration of 5 years on average), 2 of Acne and 5 Dandruff (Seborrhoeic Dermatitis).

Have been using your excellent ointment on a variety of skin diseases with very nice results."

★ ★
Have practised medicine for over 45 years but never met with a remedy to equal your Belzema Ointment in treatment of Eczema.

BELZEMA is readily
ABSORBED — NON STAIN
ING — NON-GREASY —
ANTI PRURITIC — ANTI
SEPTIC — ANTI PARASITIC
— NO BANDAGING RE
QUIRED

BELZEMA is a purely ethical product—its advertising and propaganda is confined absolutely to the Medical Profession and the fullest co-operation of its manufacturers and purveyors may be expected.

EVERY PHYSICIAN SHOULD TEST BELZEMA

ERGOAPIOL (SMITH)

AMENORRHEA • DYSMENORRHEA MENORRHAGIA • MENOPAUSE

Today, as for years, Ergoapiol (Smith) is the accepted medicament in combating those menstrual anomalies which may be traced to constitutional disturbances, atonicity of the reproductive organs, inflammatory conditions of the uterus or its appendages, mental emotion or exposure to the elements.

The physician readily can ascertain whether his prescription for Ergoapiol (Smith) has been correctly filled by dividing the capsule at the seam, thus revealing the initials MHS embossed on the inner surface, as shown in photographic enlargement.

HÆMORRHOIDAL SUPPOSITORIES

WHOOPING COUGH

Detoxicated Whooping Cough Vaccine (Genatosan) has proved remarkably successful. Reports received from medical practitioners state that it usually reduces the frequency of the paroxysms after the first injection, and subsequent injections almost invariably clear up the condition. Owing to the elimination of the toxic elements of the germ during the process of manufacture, this vaccine may be given to infants and young children, in doses sufficiently large to produce the desired therapeutic effect, with an absence of harmful reaction.

The following is typical of many reports received from physicians —

"I have been making a somewhat extensive use of your Detoxicated Vaccine for Whooping Cough, and am pleased to say that the results have been almost invariably gratifying. In nearly all my cases the very distressing symptoms have disappeared after the third injection." — M D

Additional information regarding this Vaccine will gladly be supplied on request.

'DETTOL' and Midwifery

The composition and properties of 'Dettol' make it a most suitable antiseptic for use in the conduct of labour. Its properties enable it to be used in really effective strengths on the skin and mucous membranes. It has been shown that when half a teaspoonful of 30% 'Dettol' is rubbed into the hands, allowed to dry and kept free from gross contamination, the skin remains insusceptible to infection by haemolytic streptococci for at least two hours.

'Dettol' has high germicidal efficiency and this is well maintained in the presence of blood, serum, pus and other organic matter. 'Dettol' is obtainable from chemists in 1/- and 3/- bottles, and in larger sizes for medical and hospital use. These prices do not apply in the Irish Free State and Overseas. Samples and full information on request.

This pure, unsweetened Dole Pineapple Juice packed in vacuum-sealed tins is **HIGH IN NUTRITIONAL CONTENT**

YOU can always count on unvarying quality and goodness in Dole Hawaiian Pineapple Juice. And the exclusive Dole Fast Seal Vacuum Packing Process preserves to a high degree the *desirable fresh fruit constituents*. As a result, whenever your patients open a tin of Dole Hawaiian Pineapple Juice they are greeted by a tropical aroma, by a tangy flavour of juice that is unvaryingly delicious.

The original Hawaiian pineapple juice Dole juice, has received the Seal of Acceptance of the American Medical Association's Committee on Foods. It not only contains important fresh fruit elements, but is a natural source of vitamins A, B, and C.

J K Hnsband & Co Ltd 10 Eastcheap London E.C.3

PREPARING FOR A LUAU NATIVE FEAST—There are lots of preparations to be made before the luau is ready to be served. The pig must be pounded the pig cooked in the imu—under ground oven, pineapples, bananas, and other fruits are gathered, squid and fish must be caught on the reef, and the ti leaves gathered from the mountain side, in which to wrap the food and also to serve as covering for the table.

To the happy Hawaiian there is almost as much pleasure in all these preparations as in partaking of the delicious feast.

Here is a typical analysis of Dole Pineapple Juice:

Moisture	85.3%
Ash	0.4
Fat (ether extract)	0.3
Protein (N x 6.25)	0.3
Crude fibre	0.02
Titrate acidity as citric acid	0.9
Reducing sugars as invert sugar	12.4
Carbohydrates other than sugars (by difference)	0.38

PS If you will drop us a line on your letter head, we will be glad to send you a free sample tin of Dole Hawaiian Pineapple Juice, the perfected pineapple juice.

ALASIL

Better Salicylate Therapy

WHATEVER be the season of the year there is a wide sphere of utility for "Alasil" the improved form of salicylate medication

"Alasil" is a very definite advance on ordinary compounds of salicylic or acetyl salicylic acid both in therapeutic efficiency and in freedom from the risk of unpleasant gastro-intestinal sequelae. This high tolerability is due to the fact that "Alasil" is composed of calcium acetyl salicylate—the least irritating of the salicylate compound—and "Alocoel" (Colloidal Hydroxide of Aluminium) a powerful gastric sedative and antacid.

A careful series of experimental tests has shown that "Alasil" is more completely absorbed than ordinary salicylate compounds and that it is practically free from the risk of liberating free salicylic acid in the stomach

Wide clinical experience anticipated these findings by demonstrating that "Alasil" can be pushed or prolonged to a much greater extent than ordinary salicylate compounds and that it can be given with safety to children adults the aged and patients with finely balanced digestive capacities. An analgesic antipyretic and sedative of established value

"ALOCOL"

Colloidal Hydroxide of Aluminium

Effective in Nervous Dyspepsia

WHATEVER be the fundamental cause of nervous dyspepsia, it is acknowledged that alleviation of the gastric symptoms is an important part of effective treatment

Nervous dyspepsia commotes hypersecretion. This causes flatulence sour stomach discomfort and perhaps pain. Alocol provides the ideal gastric sedative since its action is prompt and lasting and entirely free from harmful effects

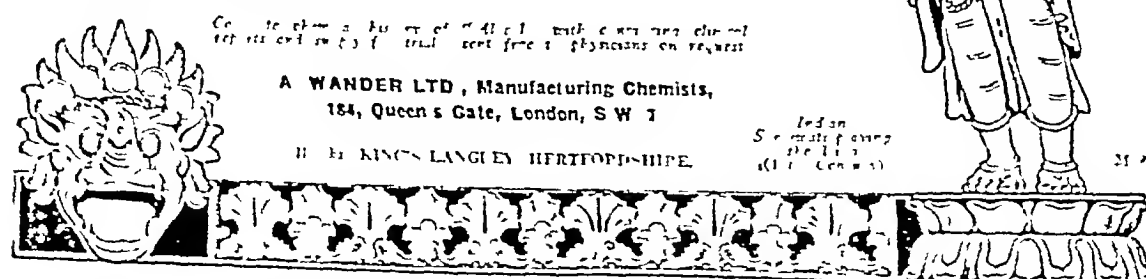

Alocol acts by adsorbing excess of free hydrochloric acid in the stomach forming a colloidal jelly which passes through into the intestines and is finally evacuated. Alocol, therefore, actually removes from the system the causative radicle (Cl) instead of merely temporarily neutralizing it. Alocol does not interfere with normal digestion nor does it determine any unpleasant secondary reactions. It is issued in tablet and powder form.

Can be given a full trial of "Alocol" with a very large clinical literature sent free to physicians on request

This symbol identifies LIVE Grape Juice

All the refreshing and recuperative benefits of the Vineyard Grape are now available in bottled form under the trade name VITA. Grapes have high therapeutic value because their sugar content is akin to human blood and their vitamins, iron and energising elements make no demands upon digestion. But they are expensive and quickly spoil. VITA, on the other hand, is good to the last drop. For VITA is just grape juice, non-alcoholic and highly concentrated

by a special process that retains all the natural "liveness". A tablespoonful in a glass of water is a suitable dose. A sample bottle is free to every practitioner on request.

RHINITOL

The Nasal Compound
in which
MISCIBILITY ENSURES EFFICIENCY

and the maximum of benefit from a minimum of Ephedrine

"I would like to express to you my appreciation of the value of your Rhinitol Intranasal preparation. I have for many years suffered from a winter catarrh, beginning with a Naso-pharyngeal about October or November and usually lasting as a semi-chronic nasal and bronchial until I go on my summer holidays. I started about October with one of your samples by putting a few drops in each nostril morning and evening and I am glad to say that for the first time in over twenty years—I am now nearly sixty—I have gone through the winter without a cold." A NEW FEATURE

Each tin of Andrews is now sealed by a patented damp-and dust proof Cellophane Cap, which maintains original Laboratory condition making a good product even better

A useful Saline Aperient

Andrews Liver Salt is an ideal Saline aperient of pleasant taste, readily taken and well tolerated by the most delicate adult or child. It ensures an easy and complete evacuation without griping or tenesmus, it is not contra-indicated in the majority of diseases where constipation arises.

Its laxative action is due to the presence of salts which, by their osmotic action, induce the flow of water through the bowel wall from the surrounding tissues. The increased fluid content of the bowel then produces gentle peristaltic contractions and a natural and efficient clearance of the colon and rectum without any unpleasant after effects.

In cases of fever, its brisk effervescing solution in water makes a refreshing and invigorating drink, relieving thirst, diluting the toxins and relieving the strain upon the kidneys. It may be used as a hydragogue purgative in the treatment of oedema, ascites, pleuritic effusions and nephritis, and with safety even in failing cardiac conditions.

Andrews Liver Salt is prepared with the greatest possible care to secure uniformity of composition, under hygienic conditions and from the purest ingredients obtainable. Andrews is manufactured under strict laboratory control.

An 8-oz Tin will be sent free, on request, to any member of the Medical Profession.

Andrews Liver Salt

Scott & Turner Ltd., Gallowgate, Newcastle-on-Tyne.

ANAHÆMIN B.D.H.

In the treatment of pernicious anaemia

It is continually being demonstrated in the ordinary routine of clinical practice that average cases of pernicious anaemia respond to an initial injection of 2 c.c. of Anahæmin B.D.H., followed by 1 c.c. injections at 10-day intervals until the blood count has remained normal for a month, whilst for the maintenance of the patient in a condition of

robust health a monthly injection of 2 c.c. is usually sufficient.

Furthermore, not only is treatment with anahæmin remarkably effective, but the cost of anahæmin therapy is exceptionally low, inasmuch as six injections, at a total cost for material to the physician of not more than 25s. or even less, suffice usually to re-establish a normal blood count within six to eight weeks.

Clinically Tested

VENTRICULIN

Desiccated Gastric Tissue

VENTRICULIN—the original gastric tissue preparation for use in the treatment of macrocytic anaemia—has always been clinically tested before issue. This is the only way in which a preparation of certain activity can be assured. The clinical tests on Ventriculin are conducted at the Thomas Henry Simpson Memorial Institute—a department of the University of Michigan devoted solely to the study of pernicious anaemia.

In addition to being a specific for the treatment of macrocytic anaemia, Ventriculin possesses the power to stimulate the haematopoietic system in anaemias of the microcytic (secondary) type also.

Iron, in adequate quantities to assist in building up the depleted haemoglobin, has long been recognized as an important element in the treatment of secondary anaemia, and research work of recent years has emphasized its value.

A convenient form for the simultaneous administration of Ventriculin and an effective iron salt is **VENTRICULIN WITH IRON**.

This preparation combines 12½ per cent of ferric citrate with Ventriculin, and has been shown clinically to be effective in cases of secondary anaemia.

Ventriculin is supplied in vials of 10 grammes and in bottles of 100 and 500 grammes. Ventriculin with Iron is supplied in bottles of 100 and 500 grammes. Each 100 gramme bottle is fitted with a metal measuring cap.

Further particulars will be sent on request.

Formula

Intestinal glands -	- 0.05 grms.
Biliary extract -	- 0.10 "
Lactic ferments -	- 0.05 "
Agar-agar -	- 0.05 "
Fiat tablet -	- 0.35 "

Initial Daily Dose
Two Tablets

Laxatives, it is well known nowadays must have two essential characteristics

1. They must be biological, i.e., they must accord with and imitate in their action the natural physiological processes of the intestine
2. They must be capable of educating the intestine so that the habit of a laxative is not formed and the intestine can function unaided when bowel adjustment is attained

Taxol has both these advantages

Taxol has not the violent irritant action of many laxatives and purgatives, but stimulates the intestine by processes which resemble those of nature. The intestinal gland which is an important part of its composition acts on the intestine by reinforcing the deficient function which has culminated in constipation. This stimulating action is gentle and does not force the weakened intestine to efforts beyond its power, which would culminate in aggravation of the constipation.

Taxol is not habit-forming. It re-educates the intestine to resumption of normal function unaided, thanks to the biological nature of its action. It contains no irritant drug of violent and artificial action to which the intestine can become accustomed. On the contrary, many stubborn cases of constipation, after a course of TAXOL, revert to normal and regular peristalsis.

DIGOXIN (B W & Co)

The pure stable crystallized glucoside isolated from leaves of *Digitalis lanata*

Used in all conditions in which digitalis therapy is indicated

2. TABLOID — DIGOXIN
SOLUTION OF DIGOXIN in water
— HYPOLOID — DIGOXIN

— 'STYPVEN' —

RUSSELL VIPER VENOM

(Not for injection)

The most effective haemostatic for superficial bleeding in haemophiles and others

It is a powerful and effective haemostatic, and is used in the treatment of all types of bleeding, including haemophilia, haemorrhoids, and other conditions.

— 'TABLOID' — SULPHONAMIDE-P

0.5 gramme (1/40 grain) tablets

It is a powerful and effective haemostatic, and is used in the treatment of all types of bleeding, including haemophilia, haemorrhoids, and other conditions.

— 'RYZAMIN-B' —

RICE POLISHINGS CONCENTRATE

Presents Vitamin B₁ in small bulk
Stimulates the appetite of adults
Promotes growth in backward children

Preserving power with each tube of Ryzamin B

— 'WELLCOME' — INSULIN

Prepared with Crystalline Insulin the Insulin of 100 per cent purity The first commercial product to be so prepared

— 'TABLOID' —

— 'EMPIRIN' — (ACETYL SALICYLIC ACID) COMPOUND

Presents Empirin and Salicylic Acid, gr 31 with Phenacetin gr 21 and Caffeine gr 1/2 in a very high state of purity

SUPREME QUALITY IS BURROUGHS WELLCOME QUALITY

MAGSYN

MAGNESIUM-SYNERGIZED ASPIRIN

Magsyn is a preparation of basic magnesium acetylsalicylate in the form of tablets. Its advantages over uncombined aspirin may be summarized as follows

The effect of the aspirin is enhanced,

The dose of aspirin necessary is therefore lower

The tolerance of the stomach for the aspirin is increased. Dyspeptics have found that they do not experience digestive disturbance after taking Magsyn

The tablets have a distinctive shape, the aspirin is disguised, and its nature may, therefore, be kept secret from the patient.

The combination has a rapid effect in headaches

It is specially suitable for children because of the small dosage of aspirin

Each tablet of Magsyn contains $7\frac{1}{2}$ grains (0.5 gm) of basic magnesium acetylsalicylate.

Descriptive literature on request.

DOSE

Adults—One to three tablets.

Children—Half to one tablet. To be chewed or swallowed with plenty of water

Bottle of 30 1/
60 1/9 120 3/

VALUE OF A SPECIFIC SERUM IN THE TREATMENT OF TYPHOID FEVER

A REPORT ON SEVENTY-THREE CASES

BY

HAROLD COOKSON, M.D., B Sc Birm., M R C P

*Physician to the Cornelia and East Dorset Hospital Poole Temporary Consulting Physician to the Poole
Borough Isolation Hospital*

AND

R V FACEY, M.B., B Ch Oxon.

Bacteriologist to the Royal Victoria and West Hanis Hospital, Bournemouth

In the past typhoid fever therapy has been largely confined to diet, hydrotherapy, and the treatment of symptoms, and few if any, of the infectious fevers due to a known organism occurring in this country have been less amenable to specific measures. Anti typhoid sera have been available for a considerable time, but these have not been subjected to potency tests by animal experiment, nor have they been standardized by titration, except for the H-antibody which is of no value since it has neither anti bacterial nor antitoxic effect. It is therefore not surprising that the clinical results following the use of such sera have been disappointing. Attempts at specific therapy with typhoid vaccine have also not given satisfaction and it is doubtful if good results if they really do occur with this method are actually due to a specific action. In any case treatment with vaccines has a limited application and in a severe attack of the disease, where the need is most urgent their use is dangerous.

Within the last year or two however following upon the work of Felix a serum prepared at the Lister Institute has been available the potency of which has been demonstrated in animal experiment in which it has been shown capable of protecting against the effects of injections of live *B typhosus* and also against the toxic action of massive doses of dead organisms (Felix and Pitt, 1934). Felix believes that virulent (Vi) strains of the organism are characterized by a special Vi antigen which renders the O antigen resistant to the O antibody, to be effective against a virulent strain the immune serum must therefore contain Vi antibody. On the other hand as Felix and Pitt (1934) have shown in animal experiments, the Vi antibody is mainly bactericidal and has no appreciable antitoxic action. From this it is clear that therapeutic anti typhoid serum should contain an adequate amount of O or antitoxic immune bodies in order to avoid an adverse effect produced by toxins liberated as a result of the bactericidal action of the Vi antibody. In addition to Vi antibody the Lister Institute serum contains O antibody which is an indicator of the potency of the serum in antitoxic activity. Estimations of the Vi titre in the sera of untreated patients show this to be low until convalescence (Felix, Krikorian, and Reider 1935). The necessity for a balance between bactericidal and antitoxic activities will be referred to again in discussing some

favourable serum effects which appeared to be delayed. It is possible that further experience will show the desirability of using the Vi and O antibodies separately, the dosage of each being controlled by serial agglutination tests.

At the present time the results in three series of cases of typhoid fever treated with Lister Institute serum have been published. Felix (1935) reported forty-three cases together with seventeen controls who received injections of normal horse serum. At first the immune and the normal serum were given to alternate patients, the medical attendants being unaware as to which was the specific preparation. Before long however, they became so convinced that a beneficial action followed the use of one of the sera (which was in fact the specific) that they refused to continue with the other, and no further controls were therefore obtained. The anti-typhoid serum used was unconcentrated and had maximum agglutination titres for Vi and O antibodies of 400 and 40,000 respectively, it was given chiefly by the intramuscular route, the usual dose being 50 c cm, but this was repeated daily in severe cases to a total of three doses. Of the forty-three cases favourable effects were noted on the toxæmia in twenty-four and on the temperature in twenty-three. Twelve patients were classed as extremely severe cases, and of these five died. C J McSweeney (1935) recorded the results in eight patients treated at Dublin, and Robertson and Yu (1936) in fifty-six patients treated in China, the serum used was either that obtained from the Lister Institute or, in the Chinese cases, was locally prepared by a similar method.

All these observers agreed in concluding that the serum was held to have a favourable effect on both the toxæmia and the temperature but assessment of its value on the basis of mortality rate was impossible since there were no controls or these were inadequate. Similarly the mortality in treated series as compared with that in other outbreaks where no serum has been used is of no value as a criterion of its efficiency because of the well-known variation in the severity of the disease from one outbreak to another. To control the results adequately it would be necessary to observe the effects in a large series of cases when serum was strictly reserved for alternate patients, all of whom should preferably be at about the

same stage of the disease. This ideal has been closely approached in investigations on anti pneumococcal serum, but up to the present it is far from being realized in clinical experiments with anti typhoid serum and because of the insidious onset of the fever it is hardly likely to be attained.

Results in the Present Investigation

A local outbreak in 1936, the result of a milk-borne infection which involved some 500 persons, provided an opportunity for the use of the new anti typhoid serum. Of approximately 500 patients admitted to the local borough isolation hospitals seventy three received serum, and with a few exceptions these were the more severe cases. Unfortunately the circumstances were not such as were likely to secure the optimum results: the majority received serum late in the course of the disease in a considerable proportion of the cases the dosage was too low (partly because of difficulty in obtaining adequate supplies) and in a few simultaneous blood transfusion or intravenous saline infusion made it difficult to assess the results. There were no controls the treatment being reserved largely for the more severe cases. The details are given in Table I. In all there were fifty-five classified as severe or very severe of which twenty seven were children aged 15 or under the total number of children was thirty four.

In assessing the results the stage at which treatment was started is important since in the later stages natural improvement is more likely and might be wrongly attributed to the remedy though this source of error will diminish in proportion to the severity of the case. During the first fourteen days of the illness twenty patients were treated (reckoning the onset from the day of taking to bed) thirteen during the third week and forty later than this. The dosage is given in Table I: it averaged 24 c cm in children and 47 c cm in adults in many instances it was probably too low as the amount for adult patients recommended by the Lister Institute is three doses of 5 c cm of the concentrated serum. A preliminary de-

sensitizing dose of 0.5 c cm was given intramuscularly. The titres of the batches of serum used estimated by agglutination were stated to be 1 in 600–700 against strain Watson and 1 in 60 000 against strain 0901, for Vi and O antibodies respectively.*

The results were considered in relation to effects on temperature and toxæmia separately, the latter was occasionally benefited apart from the temperature, though the reverse never occurred. Temperature, being an entirely objective observation, may be regarded as the more reliable criterion of effect, yet it is not in fact a simple matter to define exactly what is meant by a favourable effect. We have taken as an arbitrary standard the lowering of a previously high constant temperature within forty eight hours of the injection of serum the fall continuing for at least seven days, in many cases it reached normal and remained down permanently. Doubtful effects were classified as negative—for example, in the cases in which the temperature was falling just before the serum was given. When the result was favourable the fall in temperature was combined as a rule with an increase in the daily remission—that is the chart showed a curve similar to that observed during the phase of spontaneous defervescence in typhoid. Effects on toxæmia, the signs of which do not require definition were accepted only when well marked and if evident within forty-eight hours.

Of the seventy three cases there was a favourable action as defined above, on toxæmia in fifty-four patients (in thirty eight of these the effect being noted after the initial dose of serum), and on temperature in forty (in twenty eight after the first dose). When the cases are classified according to the period of the disease at which treatment was started the results were as follows: first fourteen days, favourable effects on toxæmia in eleven and on temperature in eight of twenty treated; third week, eleven and five respectively out of thirteen; later than the third week, thirty two and twenty seven respectively out of forty. Three patients showed no symptoms of toxæmia (Table II).

TABLE II—Serum Effects Classified According to the Period of Disease Treated

Period of disease treated	Number treated	Favourable effect on toxæmia	Favourable effect on temperature
First 14 days	20	11	8
Third week	13	11	5
Later than third week	40	32	27
Totals	73	54	40

In a further eight patients improvement was noted within two to seven days after treatment, and we have reason to think that the beneficial effects of serum may sometimes be delayed for this period. Seven of the serum-treated patients died, in two of these (Nos 38 and 41) there was sepsis, three (Nos 7, 72, and 73) had thrombophlebitis: two were over 70 (Nos 72 and 73) and three were moribund when treatment was started (Nos 38, 43, and 73). In No 32 the dosage was wholly inadequate. Case No 73, a man aged 74 was admitted to hospital on the thirty-fourth day of the disease and had been about until that time.

A few cases may be mentioned individually as being of special interest.

No 63 had a prolonged and severe illness with high temperature delusions, and retention of urine with cystitis. On

* The serum we understand now supplied by the Lister Institute is of about double this strength.

the thirty second day 22 ccm of serum were given intramuscularly but this was not followed by any definite effect. Ten days later after desensitization, 20 ccm of serum were given intravenously a severe anaphylactic reaction followed but immediately after this general improvement set in. It is possible that this favourable effect was non specific, a result of anaphylactic shock.

Case No 43 a girl of 19, when moribund, was given gum-saline and serum intravenously and intramuscularly to a total dosage of 132 ccm in a week. Delirium disappeared the patient became quiet and mentally clear, and the temperature fell. She was in an exhausted condition, however, and died six days later. Case No 62, in which serum was given very early and in adequate doses, was fairly severe, there was no immediate effect on temperature or toxæmia but seven days after the initial injection it began to fall and became more remittent, finally reaching normal on the nineteenth day of her illness.

Case No 22 a girl aged 11 was severely toxic, with abdominal distension vomiting, delirium and lethargy, showing all the features of the typical typhoid state and later there was coma with incontinence of urine the pulse was 140, being irregular and thready. On the twenty sixth day when her condition appeared desperate, 30 ccm of serum were given intramuscularly and further doses of 33 and 13 ccm respectively on the following two days. Within twenty four hours there was a marked general improvement, the patient was no longer comatose the delirium ceased, and the temperature fell by lysis, reaching normal on the thirty third day. Convalescence was uneventful with the exception of a brachial neuritis which is to be mentioned later. Case No 38 a girl, aged 16 was given 33 ccm of serum intravenously on the thirty third day and 20 ccm intramuscularly on the thirty fifth day, at this time toxæmia was severe and she was in a semi-conscious, delirious condition. After the injections the temperature remained high but the restlessness and delirium cleared for forty-eight hours, a blood transfusion the day before the first dose of serum was given had had no effect on these symptoms. Unfortunately soon after the beneficial effects were noted subcutaneous abscesses appeared and the patient died.

Serum Complications

A serum rash was observed in twenty-two of the seventy-three cases. Case No 64, a female aged 37, who had toxic goitre, had an attack of tachycardia—pulse 160—on the day following the first injection of 33 ccm intramuscularly, but this soon subsided, the second injection of 33 ccm eight days later caused no by-effects, and the patient's general condition took a turn for the better. The observation illustrates how, in the presence of toxic goitre, a reaction to serum may be excessive, just as it is to infection or trauma. Case No 22, a girl of 11, who had received a total of 76 ccm serum in three days, which is a large dose for a child developed a brachial neuritis affecting the fifth and sixth cervical roots. Owing to the patient's exhausted condition and the absence of all subjective symptoms the exact time of onset is uncertain, but it was first noticed about a fortnight after the serum was given. On stimulation electrically the reactions of degeneration were observed in the deltoid and inner head of the biceps. The condition is slowly improving but after four months there is still some weakness in the affected arm. Neurological complications of serum treatment are rare, they have been reviewed by I. M. Allen (1931) who described four types: neuritic radicular, polyneuritic, and cerebral. The radicular type, which is most common and usually affects the brachial plexus is almost indistinguishable from the toxic brachial neuritis which occasionally follows typhoid fever. There were no other signs of serum sickness, but these are not always observed in neurological serum complications. It is, however, im-

possible to decide whether the paralysis should be regarded as a serum reaction or as a toxic effect of the disease.

A severe anaphylactic reaction was seen once only (Case No 63). As already noted after the reaction an improvement in this patient's condition occurred. In two children (Cases Nos 6 and 14) a desensitizing dose of 0.5 ccm serum produced severe local and general reactions and further doses were withheld. Both of these children had been given serum a few days previously without reaction.

Conclusion and Summary

Previous reports on the therapeutic effect of Felix anti typhoid serum have all been favourable, and similarly the results of the present investigation on seventy three patients are thought to be encouraging. The serum is known to be potent in animals and while the result of the injection of *B. typhosus* into a laboratory animal is a very different matter from the naturally occurring disease in man, the demonstration of such potency in a serum would appear desirable prior to its clinical use. Some of the difficulties in assessing the value of serum in typhoid have been mentioned, and although the present and previous reports suggest that it is a remedy of definite promise, its exact worth is to be proved only by more extended use, and, where circumstances permit, with adequate controls. An adequate control could be provided by withholding all serum from alternate patients. There appears to be no need to give the controls normal horse serum, as there is already sufficient evidence that horse serum *per se* has no beneficial effect.

In a considerable proportion (73 per cent) of cases we noted improvement within forty eight hours of injection of the serum. In a further 10 per cent some benefit occurred after a few days interval, and in these it is possible that the action of the serum was delayed. Theoretically this might occur when the antitoxic lagged behind the bactericidal action, the first effect being predominantly a destruction of organisms with liberation of toxin in amounts too great to be dealt with immediately by the available antitoxin.

The mortality in the treated patients was 9.5 per cent, which may prove to be somewhat higher than in the others (the rate for the whole epidemic is not yet available), but as the former group was selected on the basis of greater severity no comparison is possible. Of thirty three patients treated during the first three weeks only one died, the dose of serum in this case (13 ccm) was inadequate.

For sporadic cases or small outbreaks, where the numbers do not admit of proper controls we believe the evidence so far available warrants the administration of serum at the earliest possible moment, and in full doses irrespective of the severity of the disease.

We have to acknowledge our thanks to the medical officers of health for Poole and Bournemouth and to the honorary physicians of the Royal Victoria and West Hanley Hospital who kindly allowed us to see patients under their direct care and to make use of their case notes.

OBSERVATIONS ON BENZEDRINE

BY

ERICH GUTTMANN, M.D.,

Rockefeller Research Fellow

AND

WILLIAM SARGANT, M.B., M.R.C.P.

(From the Psychiatric Research Unit, The Maudsley Hospital, London)

Benzedrine was first introduced into therapeutics by Prinzmetal and Bloomberg (1935) for the treatment of narcolepsy. They found it more efficacious than ephedrine in bringing about symptomatic relief in this condition, and their claim has subsequently been confirmed. When they began their work little was known of the effects of the drug on man, though some physiological investigations had already been made on animals (Alles, 1933, Prinzmetal, 1933). In the same year Peoples and Guttman made an independent study of its pharmacological actions at the Maudsley Hospital. Certain hitherto unrecorded psychological effects resulting from the administration of the drug to man were observed. In a preliminary report (Peoples and Guttman, 1936) on these findings it was suggested that benzedrine might have therapeutic applications other than the treatment of narcolepsy. Numerous people have since experimented with the drug and a few have already indicated their findings, some workers confining their investigations to its use in depression, and others dealing with its wider psychophysiological actions (Guttman 1936, Myerson 1936, 1937, Myerson and Rivo 1936, Nathanson 1937, Solomon and Prinzmetal 1937) one paper has specially stressed possible dangers and contraindications (Anderson and Scott 1936).

It is the purpose of this paper to report further personal observations of an experimental and therapeutic nature which have been collected since the preliminary communication on this subject (Peoples and Guttman, 1936). Benzedrine has now been given to over 250 in-patients out-patients and normal subjects at this hospital, in a proportion of these only the subjective and objective results of administration have been noted, but in more than a hundred cases systematic experiments were carried out.

Benzedrine (β phenylisopropylamine) is an adrenaline-like drug with an action on the vegetative nervous system. It paralyses intestinal activity, raises the blood pressure and produces other vasomotor effects to be described in detail later. It is also used in the form of an inhalant to bring about constriction of the nasal mucous membrane. It interferes with sleep and may cause pronounced psychological changes. Blood sugar levels are not affected (Peoples and Guttman 1936) and work done at the Central Pathological Laboratory of the L.C.C. Mental Service under Dr. Golla indicates that it does not produce any significant alteration in the basal metabolic rate or impedance angle. An inhibiting action on the sphincters of the bladder and rectum and an increase in the number of circulating red cells have also been recorded after its administration (Myerson, 1937, Myerson and Rivo 1936, Nathanson 1937).

Our own investigations have been mostly confined to the action of benzedrine on the cardiovascular system and the psychological changes observed. Small doses were generally employed ranging from 10 to 30 mg., larger

amounts only being used under strict supervision for experimental purposes. It was given by the mouth in the form of tablets.

Blood Pressure and Other Cardiovascular Effects

The influence of small doses on the blood pressure is limited. Fluctuations of 10 to 30 mm., however, were sometimes observed. This degree of alteration falls within the limits of experimental error and normal physiological variation but it was attributed to benzedrine when it was repeatedly observed in the same patient under exactly similar experimental conditions. Furthermore, the degree to which the blood pressure altered with the standard dose seemed almost constant for any individual. As a general rule benzedrine was given only to those who showed no cardiovascular disease, but a few cases who had extrasystoles, apparently of a functional type, were included in our experiments. We witnessed none of the severer complications reported by Anderson and Scott, but the more vasolabile subjects sometimes complained of dizziness, shivering feelings, palpitations, tremor, or anorexia. These symptoms were more frequent during the first hour after taking the drug coinciding with the time taken for its full effect to develop. The speed of absorption seems to influence the occurrence of these reactions so that it is inadvisable to give the tablets on an empty stomach. Other autonomic disturbances rather than the actual rise in blood pressure appeared mainly responsible for these symptoms and sometimes they were precipitated or increased by physical effort and emotional upset.

Psychological Effects

Benzedrine produces a general psychological stimulation. Subjectively this is experienced as increased confidence, initiative and ease in making decisions sometimes combined with a feeling of restlessness. There is also a pronounced impulse to talk more than usual. The restlessness may be pleasant or unpleasant, depending on the degree to which it is accompanied by the somatic symptoms described above. In the absence of these a pleasant sensation is reported which often amounts to a real degree of euphoria. Objectively, it is the increased talkativeness and activity which most impress the outside observer. Thinking processes appear to be speeded up without impairing attention, concentration, or judgement and the features of total personality make up that seem to benefit most are retardation, indecision, mild depression, and hesitation. It has already been shown that in certain cases intelligence test scores are improved (Sargant and Blackburn 1936). Medical colleagues and others who have themselves taken benzedrine have found it of definite value in such tasks as lecturing or taking an examination. It also helps to remove mental fatigue brought on by excessive work or worry. Important interviews of various kinds have been tackled more confidently than usual under benzedrine especially those requiring quick thought and ability to talk convincingly and fluently.

When the dose is sufficient to cause physical or psychological changes disturbances of sleep are rarely absent. There is difficulty in getting to sleep and sometimes patients wake up during the night or too early in the morning. This sleeplessness is not always unpleasant. It is reported by some as being contentedly in bed in contrast with the distressing restlessness of the insomnia in many nervous illnesses. The effects of the drug often persist the following morning so that the subject gets up

feeling surprisingly fresh and active in spite of the comparative lack of sleep. No changes in the blood pressure have been found to remain the following day.

Normal Subjects—In different subjects there is a wide variation in the response to benzedrine. It has been found almost impossible to correlate exactly an individual's response to the drug with his personality make up. This can only accurately be determined by trial. However, as a general rule it may be said that in the doses used benzedrine tends to exaggerate some of the innate characteristics of the personality besides producing the effects described above. For instance, one can assume that some of Anderson and Scott's subjects who complained of "a funny feeling not quite amounting to pain" seven hours after taking benzedrine must be somewhat hypochondriacal as, indeed, was expressly stated in one of their case reports. We ourselves are diffident of giving the drug to people who have hypochondriacal tendencies. Mildly obsessional personalities may also be upset by it, but in this group there were some who responded extraordinarily well, especially hesitant individuals who show a tendency to obsessional doubt and difficulty in making up their minds about any small or unimportant matter. Persons with cyclothymic tendencies had by far the most constant and beneficial reaction from the drug, and it usually gave them a characteristic euphoria.

Depressive Illnesses—Mild depression accompanied by retardation is the most favourable of all psychological disorders for benzedrine therapy. It has been found that these patients may be carried over periods of temporary disability by regular medication. In several cases the possibility of benefit being due to suggestion was ruled out by the occasional substitution of "inert" tablets which never produced the same effects. Severe depressions and depressive stupor do not react to the drug in the same way, small doses have little effect and heroic doses appear to produce anxiety symptoms. Other workers, in personal communications to us, have reported 'dramatic' effects with 40-mg doses in severe depressions but it has been our experience that such improvement is transient and resists repeated medication. At the end of a depression, however, its use is more promising. It may enable a patient to start work or take the initial steps to social readjustment earlier than without it.

At the beginning of an endogenous depression it may also be of use by delaying for a time the onset of the more severe stages of the illness. For instance it enabled one patient who felt he was developing one of his recurrent depressive attacks to carry on important work for an extra week and to make business arrangements for the period of his approaching illness. By the next week, however the endogenous retardation was too severe to yield to the drug. It is interesting to note that Krapf (1936) observed a marked variability of the blood pressure at the beginning and end of endogenous depressions while during the main period of the illness the blood pressure is relatively stable. Thus the periods in which benzedrine is most efficient appear to coincide with times at which the blood pressure is most variable.

Anxiety States—Anxiety is common in many psychiatric syndromes and when the somatic symptoms of anxiety such as palpitation tremor etc., are prominent benzedrine is usually contraindicated as these symptoms are often exaggerated by the drug. A few patients however reported that they did not worry so much about anxiety symptoms when taking benzedrine and some cases clinically labelled as anxiety neurosis considerably improved. This finding is probably due to the beneficial

effect of benzedrine on symptoms of indecision or depression complicating the picture.

Schizophrenic Illness—Because of the variety of clinical manifestations met with in schizophrenia it is difficult to make any general statement as to the effect of the drug. Nevertheless certain patients may benefit—namely, those in whom there is a lack of initiative. These welcome the stimulation produced by benzedrine, and objective improvement in their activity also occurs. One of our patients, an artist who had given up drawing during his illness, started again when given benzedrine but he only drew on his benzedrine days and not on the control days. Another patient convalescing from a schizophrenic illness reported a similar relief from his persistent feeling of fatigue and resumed playing the piano. It was impossible however, to interrupt a schizophrenic stupor with the drug, and it definitely made some hallucinated and deluded patients worse. We found it particularly dangerous to give benzedrine to those in whom a superficial depression masked the underlying schizophrenic illness. It caused a severe exacerbation in the symptoms of one such patient, who would almost certainly have attempted suicide while under its influence had she not been subject to hospital supervision.

Narcolepsy—The claims of Prinzmetal and Bloomberg (1935) have been confirmed by our observation and those of others. One patient with idiopathic narcolepsy has taken 10 to 20 mg a day for over a year with constant relief from her symptoms, which for many years had resisted other forms of treatment. We observed a similar effect in a patient in whom the narcoleptic attack appeared symptomatic of cerebral arteriosclerosis, and the narcoleptic attacks in the post-encephalitic syndrome are also lessened by the drug.

Relation of Psychological Effects and Blood pressure Alterations

Experimental observations on individual cases have shown that the rise in blood pressure and the psychological phenomena observed do not necessarily coincide in any individual. Patients with little alteration in blood pressure may exhibit profound psychological stimulation and vice versa. This experimental finding in individual cases was borne out by recording the blood pressures of forty-eight subjects during intelligence tests under benzedrine. Ten of them increased their test scores by ten points or more but it was found that only one of these showed a concomitant rise in blood pressure of over 20 mm. The cases with rises of 20 mm or more, with this one exception failed to attain the same degree of improvement in their test scores. We also saw a paradoxical fall in the blood pressure after giving 10 mg of benzedrine to certain cases of anxious depression. We assume that in these cases the psychological effect of the drug was sufficient to influence the emotional tension (with its accompanying increase of blood pressure) while the dose was too small to have a physiological effect on the blood pressure itself.

Practical Considerations

We have found that benzedrine gives the best results when used in doses of 10 to 30 mg. Larger amounts often produce so much palpitation tremor, and rise in blood pressure that the concomitant psychological effects are apt to be destroyed. The smallest dose that will bring about the required psychological stimulation should always be used and this is determined by starting with a dose of 10 mg and then increasing it if necessary. The drug

should be given before midday if sleeplessness is to be avoided, on the average the effect tends to remain at a maximum for about five hours and takes an hour or more to develop fully. The psychological stimulation is not always maintained on continuous daily administration. Some patients complain that it loses its euphorizing effect after a few days, while the disagreeable features become more predominant.

The possibility of addiction needs to be guarded against, and the case of a person who had been purchasing benzedrine at chemists shops without medical supervision has already come to our notice, though none of our own patients have so far shown a tendency to addiction. The preponderance of disquieting somatic symptoms over the feeling of euphoria when large doses are taken, and the sleeplessness make us think that addiction will be rare. At present however, benzedrine may be purchased at any chemist's shop without prescription and this seems inadvisable with a drug all the properties of which have yet to be fully investigated. It must also be emphasized that the therapeutic indications for its use apart from the treatment of narcolepsy have not been exactly formulated. It is to be hoped that this drug will not be discredited by misuse.

We wish to thank Professor E. Mapother for his kind permission to use the clinical material of the Maudsley Hospital and Dr F. Pilkington for help in the preparation of this paper.

M. Dechaume (*Presse med* March 24 1937 p 451) reports a case in which intense pain followed the removal of a wisdom tooth from the lower jaw on the left side. Extraction was carried out under local anaesthesia, and during the process severe pain radiating to the ear was felt and the operation could not be completed until the nerve trunk had been injected. A small filament resembling a nerve came out of the socket and this was cut off slight pain being felt in the chin during the process. This was followed by intolerable pain in the left half of the face. Three days later an injection of novocain without adrenaline was given around the facial artery so as to paralyse the sympathetic nerves and this relieved the pain. The following day severe pain recurred but became less intense after a second injection. On examination the socket was found to contain pus and as an antiseptic could not be used on account of the pain a plug of gauze soaked in novocain was applied for several seconds. During the next week symptoms subsided with the exception of anaesthesia in the left half of the lower lip and chin. It is pointed out that although it was unusual that a nerve should have been torn during the removal of the wisdom tooth this could not have been foreseen. Injection of the sympathetic for relief of pain has been tried successfully in other instances. The injection causes a vasodilatation and increases the blood supply to the part but the effect is transitory and the treatment must be repeated.

TECHNIQUE IN OPERATIONS ON THE KNEE-JOINT*

BY

ERIC I. LLOYD, M.B., B.Ch., F.R.C.S.

Orthopaedic Surgeon to the Royal Northern Hospital
 Surgeon to the Hospital for Sick Children Great
 Ormond Street

The knee joint has been derived from the fusion of three articulations, and this makes it the most complex as well as the largest joint in the body. It is only comparatively recently that this field has been made safe for surgery, and the layman still has a fear that the removal of a semilunar cartilage may leave him with a stiff knee. Such an event is now a rare calamity, but it has occurred and still occasionally does so. Knee joint surgery is recognized to demand the most careful technique, and I am going to describe a scrupulously careful procedure which stops short of fustiness. At the same time we shall have an opportunity of seeing that technique in these cases must include the care of a patient both before and after the operation.

The chief boggy is sepsis and it can only arise in one of two ways—namely, by infection from without—that is, errors in aseptic technique—and by infection from within—that is from a focus of infection elsewhere in the body. We must note that either of these events is greatly facilitated by the presence of blood in the joint. Blood is an excellent culture medium for organisms and both a haematoma and a haemarthrosis are readily infected from without or from within. We all know that a haematoma in an operation wound prolongs convalescence for only a few days if it is at once evacuated, but becomes a much more serious trouble if it lies hidden until infection has occurred. A haemarthrosis differs from a haematoma only in its size and the character of its limiting membrane. A dry joint is probably quite able to cope with occasional organisms, which rapidly, however, become a massive infection when incubated at body temperature in a large blood filled synovial cavity.

Preliminary Examination

Preliminary examination of all patients with cartilage injuries should include examination of the teeth. It is certainly dangerous to open a knee joint while dental sepsis remains untreated. If any extractions or fillings are necessary it is wise to allow at least three weeks to elapse before opening the knee joint. Equally, any other infection such as tonsillitis, boils or an infected antrum demands postponement of the operation until the potential danger has been removed.

Preparatory Dressings

The skin is one of the chief dangers; the preparatory dressing is an important prelude to the operation and a couple of days is not too long to devote to it. No procedure can make the skin completely sterile because antiseptics can only act superficially. We must do the best we can and then proceed on the assumption that we have only been partly successful. The whole limb from the toes to the groin is first shaved and then washed with soap and water. Methylated spirit compresses are applied to this area for twenty-four hours and a solution of iodine in spirit is next painted on the skin. The whole limb is then covered with sterile towels which are

* Based on a lecture delivered at the Hospital for Sick Children Great Ormond Street.

bandaged firmly in position and left alone until the surgeon directs their removal at the beginning of the operation

Operation

It is the surgeon's duty to develop a safe technique, but he is equally concerned with that of his assistants, who are probably less familiar with the requirements of the situation but are none the less capable of ruining an operation. We shall assume that there are two assistants—namely, the surgeon's immediate assistant and the theatre nurse, who is dealing with swabs, instruments, and sutures

The Theatre Nurse

Anyone who undertakes to thread needles or hand ligatures ought to be able to do this without touching the needle or suture material with the gloved hands. There is no particular difficulty about it when once the necessity is realized, and anyone can do this with a little practice. The dangerous politeness of holding an instrument by its point and passing it handle first to the surgeon is forbidden, and instruments are passed with forceps. The fingers must not touch that part of any instrument which is now or in the future going into the wound. The passing of swabs must also be done with instruments, for it is futile for the surgeon to be careful if the nurse is careless or untaught, and vice versa. The strength of the aseptic chain is that of its weakest link

The Assistant

What has already been said about sutures and instruments applies equally to the assistant, with the added special warning that double-ended retractors are dangerous in most people's hands. All swabbing must of course be done with forceps and no swab should be used twice. The wound must not be rubbed, but firmly dabbed and wiped from within outwards never from without inwards. Some assistants love to swab a dry wound just to look busy and co-operative; they insult the tissues and their own intelligence. Better a lazy than an over-zealous assistant in knee joint operations

The Surgeon

The anaesthetized patient is laid on the operating table in the dorsal position with the line of the knee joint half an inch below the hinge of the table's foot piece. A nurse uncovers the big toe, which the assistant grasps with a swab. He elevates the whole limb whilst the preparatory dressing towels are removed. A large towel is slid under the limb and another is placed across the abdomen while a third and smaller towel covers the foot and leg below the knee-joint and is secured with a sterile bandage. This method of fixation is much better than any number or any make of towel clips

An Esmarch rubber bandage is then applied spirally from the toes to the upper third of the thigh where it is secured with three superimposed tight turns and three looser ones. The lower part of the tourniquet is then removed, the operation area painted with iodine, and a small towel placed over the thigh immediately above the patella. The operating table is now pumped up to its full height, the foot piece is lowered or removed, and the surgeon takes his seat on a stool of such a height that the patient's foot is resting on the operator's knee. Some surgeons operate with the knee on an adjustable wooden frame but my own preference is for the leg hanging over the end of the operating table so that movements of rotation are easily carried out during the operation and

a direct view of the joint is obtained. In this position however, it is particularly dangerous to cough or even talk into the wound. Probably the ordinary type of mask is unreliable, and anyone who opens a knee joint while suffering from a cold, influenza, or sinusitis takes risks

Operations on the knee-joint are by no means easy, and the difficulties are largely those of space and light. The latter is greatly improved by the use of a head light even in an undarkened theatre, and it is worth anybody's while to acquire a certain dexterity with this unorthodox paediatric adjunct. The surgeon must of course observe the same rules as he imposes upon his assistants in the matter of handling swabs, instruments, and sutures

The incision is made straight down through the skin and fat until the capsule of the joint is reached. At this stage many surgeons apply skin towels to the edge of the wound, but I look upon this as a piece of self-deception. It is difficult to get them to lie close on a curved wound, and they are inevitably contaminated by subepithelial organisms which they smear into the deeper tissues. Most skin towel clips are ineffective and only succeed in occupying some of the available space through which the surgeon gains access to the joint, so that they compel a longer incision than is really necessary. If the skin towels are waterproof some of these objections have less weight, but I still believe the operation is safer with out them if the following procedure (Dunn) is adopted

The cut edge of skin and fat is sterilized by lightly swabbing with iodine solution, the knife is then discarded or sterilized and the joint capsule incised for the same length as the skin incision

Procedure inside the joint will be determined by what the surgeon finds, but there are two instruments which are particularly useful, though neither of them was designed for knee operations. The first is a very sharply curved Lane's cleft palate elevator, which is better than a sharp hook or aneurysm needle for dragging forward the crescentic edge of a semilunar cartilage before severing its anterior attachment. The second is Denis Browne's gland holding forceps, which, owing to its rat bite grip allows the necessary hard pull on the freed anterior portion of a cartilage during the removal of its posterior part. I use an ordinary narrow-bladed scalpel for removing the cartilage though there are two or three specially designed patterns on the market

The procedure to remove a damaged cartilage is as follows

Hook forward the anterior horn and divide its attachments. Seize the part so divided together with any split fragment such as a bucket handled cartilage and pull it towards the centre of the joint while you cut along the periphery of the cartilage for half its circumference. Now take a new and deeper grip on the cartilage, rotate the foot away from it, and pull quite hard on the cartilage while the point of the knife stabs and snicks the remaining peripheral attachment as far back as can be reached

If the posterior horn is attached normally you should now cut across the cartilage and leave the posterior one fifth behind, but if trauma has detached it you will find (as Naughton Dunn points out) that it plops forward and you can then easily remove the whole structure intact. It seems reasonably certain that a small posterior normal fragment can be left behind with impunity but of course there will be trouble if a detached posterior horn is not removed. In my view a posterior incision is rarely necessary and should be reserved for examples of what might be called "failed anterior approach". I have yet to meet

one in my own operated cases which makes me think that complete transverse tears through the posterior part of the cartilage must be uncommon

The under surface of the patella and as much as possible of the opposite semilunar cartilage should be examined as far as the incision allows before closing the joint

The capsule is sutured with a continuous catgut stitch in two layers. Iodine is again applied to the edges of the wound which are approximated with a continuous suture of silkworm gut

Dressing

This is a most important part of the treatment of these cases. The tourniquet is still in position and the joint cavity free from blood. A slack dressing will allow effusion when the tourniquet is removed whilst a very tight bandage will obstruct the circulation and cause oedema below the knee. The best and safest dressing is the following (Bantart)

A generous amount of gauze and wool is applied to the knee joint whilst the rest of the limb from toes to tourniquet is wrapped in cotton wool to the thickness of an inch or more. A series of 6 inch bandages is then applied really tightly from below upwards, so that a steady elastic pressure is maintained not only on the knee joint itself but also upon the area of the limb below and above it. The tourniquet is finally removed and a layer of wool and a firm bandage takes its place. Providing there are no constitutional disturbances this wool compress is left untouched until the stitches are removed on the eighth day and the patient next day starts walking and begins a course of faradism to his quadriceps. I firmly believe that this simple method of treating operated knees is a most trustworthy safeguard against the troublesome and indeed dangerous haemarthrosis which occasionally follows other methods.

Post-operative Care

No splint is necessary and the patient moves his limb as much as he cares to do. Active contraction of the quadriceps muscle with the knee straight may be practised in bed after the second day and walking, rowing, and cycling exercises are encouraged as soon as the stitches are removed.

Complications

1 *Haematoma* occasionally occurs between the skin and the sutured capsule. If the temperature is raised above 100° F. on the second or third day the dressing should be at once removed and the wound inspected and palpated. If its edges are bluish red and the operation area is indurated but the joint itself normal a probe must be inserted between two stitches the blood evacuated and the wool compress replaced. This generally closes the incident.

2 *Haemarthrosis*—The patient is never really comfortable after operation and his temperature rises with his pain until it may reach 103° F. in a day or two. The knee joint is so distended and painful that morphine may be required. Aspiration at once relieves the patient's pain and the surgeon's anxiety but gradual subsidence is usual even if nothing is done though perhaps this inactivity risks infection from the blood stream.

3 *Stitch abscess* occasionally occurs two or three weeks after the operation but clears up rapidly on removal or discharge of a small piece of catgut. Usually it is quite superficial and does not delay convalescence.

4 *Passive effusion* into the knee-joint commonly appears when the patient begins to get up. It is generally attributed to quadriceps insufficiency, and is best treated by daily faradism to the quadriceps with a wool pressure bandage over the joint. The effusion is serous and does no harm if it is actively treated from the outset.

General Convalescence

It is often six or eight weeks before full free, and painless movement is regained after a straightforward operation for a cartilage injury, but exercise and some forms of sport are possible a good deal earlier and the patient can usually resume his ordinary life two or three weeks after operation.

The results of these operations are most gratifying to both patient and surgeon but diagnosis must be exact and anyone who undertakes knee joint surgery ought to be able to feel that his technique is as safe as he can make it.

TREATMENT OF SOME ERRORS OF METABOLISM AT BRITISH SPAS*

BY

G. L. KERR PRINGLE, M.C., M.D. Ed.

Consulting Physician Harrogate Royal Bath Hospital

After a number of years' practice at a spa one comes to definite conclusions as to the type of case which does best and which obtains the most relief from a cure there. My own experience leads me to believe that the most suitable are those due to some error of metabolism in which the liver is the chief offender among these may be mentioned congestion of the liver disease of the gall-bladder, gout, gouty glycosuria, so-called gouty eczema, some forms of obesity, and certain chronic rheumatic states.

In using the term "spa treatment" I refer to definite balneological treatment—that is treatment with waters and baths—and not to other forms of physiotherapy such as diathermy, ultra violet rays, massage, etc.

During recent years the medical profession would appear to consider that spas are useful only in the treatment of chronic rheumatic diseases and it is by no means unanimous even on this point as at the discussion on the treatment of chronic rheumatic diseases at the Oxford meeting Dr H. L. Tidy (1936) confessed scepticism regarding the advantages of spa treatment over hydrological treatment away from a spa. The profession seems to have forgotten that the spa is primarily and particularly useful in the treatment of disturbances of metabolism.

I had not been long in spa practice before I noticed that patients with disturbances of liver function, simple congestion, enlargement due to long residence in the Tropics or associated with gastro-intestinal catarrh all did well. Cases of plethoric gout and glycosuria associated with gout improved enormously under the administration of mineral waters and baths. Further it was observed that patients coming for treatment for sciatica or other rheumatic conditions often gave the information that they had been under treatment at a spa a number of years previously for an attack of gall stones or gall bladder disease from which they had since been quite free also that certain cases of rheumatism cleared up with waters.

* An elaboration of part of a lecture on spa treatment read before the Anshire Division of the British Medical Association December 1936.

alone and without any treatment other than mineral water baths—that is, cases due to metabolic disturbances.

We have in Great Britain a number of spas which are particularly suited for the treatment of these metabolic errors—Cheltenham and Leamington with their sulphated waters and the sulphur-saline group of Harrogate, Llan drindod and Strathpeffer. Unfortunately the exact physiological actions of these waters (with the exception of the Old Sulphur Well at Harrogate) have never been worked out and the evidence of their usefulness is entirely clinical. We know from such clinical evidence that the waters of Cheltenham and Leamington in full doses are purgative in action and stimulate peristalsis, that they are useful in the reduction of fat and abdominal plethora, also in catarrhal jaundice and hepatic congestion, uric acid, gravel, gout, and gouty glycosuria. The sulphur-saline waters contain large quantities of sodium chloride, are purgative in action, and effect a marked increase in the output of bile. Laborious investigations on the Old Sulphur Well at Harrogate were carried out first by William Bain and secondly by David Brown and Woodmansey. The physiological and clinical evidence shows that this water is especially useful in abdominal plethora, hepatic congestion, certain forms of toxæmia, gout, sequelae of malaria, metallic poisons such as lead and mercury, some forms of skin disease and also of rheumatic disease. Harrogate possesses half a dozen other sulphur wells which are used for internal treatment, and which vary in the strength of their chloride and sulphur contents. The waters of Strathpeffer stand in a separate category: the chloride content is small, and the purgative effect is produced by the presence of magnesium salts in fairly large quantities. The sulphur content is mainly in the form of H_2S .

Congestion of the Liver

The liver helps to prepare all three food materials—proteins, fats, and carbohydrates—for utilization by the tissues, and acts as a clearing station between the portal and systemic circulation. This much abused organ is slow to respond to continual insults and when gastric symptoms reveal dietetic failings, the liver, less obvious in its response, is nevertheless the sufferer. The excessive flow of abnormal intestinal toxins, by placing an unnatural strain on the function of the liver cells, leads to congestion producing tenderness on palpation and a sense of weight in the hypochondrium, and the urine contains large quantities of abnormal constituents.

Congestion of the liver due to overeating, alcoholism, insufficient exercise or stasis in the circulation, sedentary occupation, habitual constipation, or induced by diseases of the heart, lungs or uterus improves much by a course of any of these waters. In the Tropics prolonged exposure to high degrees of temperature combined with over full and over rich feeding, alcohol and deficiency of muscular exercise tends to produce a hyperæmia which passes into congestion with blood stasis and sometimes frothy diarrhoea. Such patients do remarkably well with any of the above mineral waters.

The benefits derived from the internal use of these waters is materially assisted by the external use of packs—mustard and mud—applied over the liver and followed by a needle bath along with such hydrological treatment as massage-douches and immersion baths. Early cases of cirrhosis of the liver, even when associated with ascites, do well under such treatment and improvement is maintained provided there is complete abstinence from alcohol. Where anaemia is associated with these conditions the

course of sulphur or sulphated water can be followed up by one of the mild iron waters that are to be found at many of these spas, such as the Kissingen and Crescent saline springs at Harrogate.

Diseases of the Gall bladder

In most instances the treatment of this condition is symptomatic, and no attempt is made to strike at the underlying causes. Usually once the case is diagnosed by x rays as one of gall stones the surgeon is called in. Gall-bladder disease is practically always a secondary condition. Rehfuess and Nelson (1935) consider that there are three fundamental factors in its causation—(1) the metabolic, (2) the problem of infection, (3) the question of stasis.

1 *The metabolic factor* involves several organs, the liver, which manufactures bile, the gall bladder itself which collects the bile and acts as a reservoir and appears also to concentrate the bile as the bile leaving the gall bladder is more concentrated than the hepatic bile, the nervous mechanism, which concerns the expulsion of bile into the intestinal canal, which is itself drained by the portal system. Analysis of hepatic and gall bladder bile shows that the cholesterol content of the latter is much greater than can be accounted for by the concentration which takes place in the gall bladder. Considerable importance attaches to the bile salts which are elaborated by the liver cell, the cholates which in some way tend to hold cholesterol in solution. The bile acids are divided into two groups—glycocholic acid and taurocholic acid, the former on decomposition yielding glycol and choline, the latter having particular influence on fat metabolism. Fats act as a strong stimulant for the contraction of the gall bladder, and therefore a low fat diet will act as a splint to the gall-bladder by helping to prevent contraction and a low cholesterol dietary should be beneficial in reducing bile cholesterol. To-day we distinguish choleric drugs which appear to affect the liver cell, and chologogues which affect gall bladder function.

The portal system draining the whole intestinal canal is another metabolic factor of great importance. The majority of gall bladder cases have a history of constipation with resulting toxæmia and a heavier burden on the liver cell.

2 *The Infection Factor*—Most pathologists now accept the view that infection is by the systemic circulation and it is not probable that it creeps up the common duct from the duodenum. Foci of infection in the teeth, tonsils, sinuses, and bowel, as in arthritis, are presumed to play a large part.

3 *Stasis*—This question is still *sub judice*. German workers at one time laid great stress on this factor. Visceroptosis and the asthenic habitus may have some part in its production.

Treatment of Gall bladder Cases

Much will depend on whether the case is one of cholecystitis (i) associated with gall stones, (ii) without gall stones or (iii) jaundice in the non-calculous cholecystitis. Diagnosis of these three varieties is essential—a radiograph is of primary importance and where there is jaundice the employment of the van den Bergh test is essential. When the condition is associated with the presence of gall stones the question at once arises whether operation is necessary and when it should be carried out.

Wilkie (1934) recently laid it down that in well-established cases of infection of the biliary passages with gall stones surgery was the rational treatment, but if surgery

was to be undertaken the preliminary preparation of the patient was as necessary as the operation. For many the operation was a great ordeal, and he referred to the diminished mortality in cholecystectomy due to doubt to increasing surgical experience but in the main to the increased attention to the pre-operative regime. When cholaemia supervened benefit had been found by the application of heat through the lower part of the chest, and we must get away from the idea that we are not dealing with obstruction due to stone, or irritation due to stone but with a disordered physiology which affected the liver. If these remarks apply to gall bladder disease with the presence of calculi they apply even more to cholecystitis without calculi, and also to non-obstructive jaundice.

Non surgical treatment is of three kinds (a) dietetic, (b) medicinal (c) balneological.

(a) *Dietetic*—The dietary in the pre-operative case of gall stones is of great importance. Two points must be observed (i) to keep the gall bladder at rest, (ii) to try to diminish the cholesterol content of the bile. Therefore fats and fatty foods should be avoided. Butter, fats, all fried foods duck, goose, pork, cheese, and fatty fish such as salmon, mackerel and herring should be removed from the dietary, also eggs as being rich in cholesterol. Milk as ordinary butter milk and skimmed milk, may be taken and vegetables lean meats, poultry, and non fatty fish all either grilled or roasted but never fried. Where there is no evidence of calculi it may be necessary to assist the gall bladder to contract and a diet containing fats may be ordered.

(b) *Medicinal*—It has already been shown that there are two varieties of drugs—the cholagogue which act on the bile forming function of the liver, and the chologogues which act on the gall bladder function. There is however no absolute distinction because many chologogue drugs have a cholagogue action. Sodium sulphate is one of the oldest of the chologogues employed and is the chief constituent of the springs at Cheltenham, Leamington and Carlsbad. It has been shown that its administration is followed by a distinct fall in blood cholesterol. There are numerous vegetable chologogues such as podophyllin, euonymin, aloes, iridin etc. Ox bile however is probably the best chologogue known and the preparations decholin, colalin or panbiline prepared from the active constituents of bile may be employed. Decholin is reputed to have an effect on the liver cells as well as on the gall bladder. William Bain (1935) working on a human subject with a biliary fistula showed that the ingestion of the Old Sulphur Spring water at Harrogate promoted an increase in the flow of bile in both total quantity and total solids and no other drug or mineral water such as euonymin, iridin etc. gave such a striking increase. Bain also claimed that this effect was in part due to stimulation of the hepatic cells. Brown and Woodmansey (1929) investigated the effects of this water on the general metabolism using human subjects; they found that during the period when the water was being taken there was an increase in the amount of total solids excreted by the kidneys and sweat glands. A marked increase in the excretion of sulphur by way of kidneys, bowel and sweat glands was recorded. This increase was greatly in excess of the amount contained in the water ingested. They also reported an increase in the excretion of total nitrogen, creatinin, uric acid, urea and hypoxanthin as well as the elements calcium, potassium, and manganese. The ions of barium and sodium were found to be retained in the body. They therefore conclude that the drinking

of strong sulphur water causes an increase in general metabolism. They also found that this water has strong bactericidal properties. Bain made further experiments with the Harrogate springs on the isolated heart and on the intact animal and found that blood pressure and cardiac systole are both gently increased with the strong sulphur water. These physiological findings support the clinical evidences with which we have been familiar for many years.

(c) *Physical and Balneological*—At eliminative spas such as Cheltenham, Leamington, and the sulphur saline spas, the accompanying constipation may be benefited by intestinal lavage reinforcing the mineral waters taken by mouth. Heat in the form of mustard or mud packs combined with needle baths, massage, douches or hot immersion mineral water baths are all aids which are at hand and should not be neglected.

Gout and its Treatment

Clinical evidence has taught us that certain manifestations of disease such as occur in eczema, phlebitis, or bronchitis, are of a gouty nature. Gout may be regarded as an inborn error of metabolism though it is quite possible that foci of infection may be the causal agent in precipitating an attack. Acute gout is not as evident as it was thirty years ago but there are indications that it is on the increase again, though probably in a less acute form. The young physician of to-day is apt to look on this disease as a pathological rarity but I am confident that many cases of the milder types are overlooked and are diagnosed as rheumatism, arthritis or cellulitis. A history of mild attacks in a single joint, the presence of tophi, a history of hereditary biochemical findings—that is raised blood uric acid over 3.5 per cent—hypercholesterol aemia, x-ray findings—that is punched-out areas of rarefaction in articular ends of bones—point collectively to a case being one of gout.

The spa treatment of gout comes under two categories—treatment of a recent acute or subacute attack on the one hand, and prophylactic measures against recurrence. In treating acute gout spa treatment is harmful while any inflammatory signs are still present. This is one of the pitfalls of spa practice, as too energetic treatment is apt to cause a recrudescence of the disease, no matter whether the water of Bath, Buxton, or sulphur spa is employed. A few days rest in bed on arrival at the spa with the internal administration of colchicum and calomel will usually prevent a relapse. The internal administration of mineral waters such as those of Bath and Buxton and the mild sulphur, can then be employed along with local applications of peat and mud or hot air. Caution must be observed with baths which involve massage or other physical measures and ordinary exercise must be curtailed. No definite rule can be laid down—the physician has to feel his way with each individual case. Cases of gouty glycosuria usually clear up after three or four days' treatment and cases of gouty eczema often do so on the sulphur water alone without the aid of alkaline sulphur baths.

Diet is important in all cases. Lockie and Hubbard (1935) have found that diets high in fat and low in carbohydrates and protein tend to precipitate an attack with an increase of hyperuricaemia. These findings have not so far been confirmed in this country but they should be borne in mind. When spa treatment is used as a prophylactic measure one must still be on one's guard against precipitating an attack otherwise more active measures may be employed.

R G Gordon (1936) in a recent paper drew attention to the metabolic factor in chronic rheumatism with special reference to fibrositis, and observed that the pendulum had swung too far, and that we must consider some cases of chronic rheumatism to have a gouty basis, quite apart from the question of the presence of a focus of infection. This same viewpoint I raised at the discussion on chronic rheumatic diseases at the Oxford meeting of the British Medical Association last year. Further, I pointed out that there were cases where there might be no evidence of an infective focus. For instance, patients tell you that they get pains and aches in their muscles (a sprained feeling) after drinking beer or Burgundy, after eating strawberries, asparagus, etc., or after taking a purge and patients suffering from glycosuria often complain of such symptoms. Another group of patients will tell you that when they get out of bed in the morning their feet feel tender, their hands are stiff, and their grip is weak. By the time they have completed dressing this discomfort has passed off. On examination there may be no physical signs beyond perhaps some tenderness on squeezing the metacarpophalangeal joints as in a vigorous handshake. Such cases improve much by the use of sulphated or sulphide waters, and by trying to correct the errors of metabolism, quite apart from general physical treatment.

Post malarial Cachexia

The waters of these spas are also distinctly useful in the cachexia following malaria. Enlargement of spleen and liver derives much benefit from a course of these waters, combined with baths, exercise, change of air, etc. In the winter and early spring Cheltenham and Leamington are more suitable, while in the summer months the more bracing climate of Harrogate and Strathpeffer works wonders. In fact, I know of no type of case which shows greater and more rapid improvement with a course of these waters. Many residents in the Tropics, from India, Malay West Coast of Africa, etc., make it a practice to have a "cure" during their periodic leaves home, mainly as a prophylactic measure.

A comprehensive survey of obesity and emaciation due to pathological causes by Professor Francesco Galdi of Pisa and three of his colleagues is published in the proceedings of the forty second congress of La Società Italiana di Medicina Interna held in Rome in October 1936. The authors comment on the extensive literature, especially from German and American sources dealing with obesity, and the comparative neglect of pathological loss of flesh. The relation of metabolism of the nervous system, and of the endocrine glands to these conditions is fully discussed, and some sixty pages are devoted to more detailed separate analyses of the metabolism of proteins carbohydrates and fats. Following a description of the pathological anatomy of both conditions the several forms of obesity and emaciation are considered in their clinical aspects.

POST-SCARLATINAL NEPHRITIS

A STUDY IN PREVENTION

BY

B A PETERS, M D Cantab, D P II

Medical Superintendent Ham Green Hospital Bristol
Lecturer in Infectious Diseases University of Bristol

AND

IRIS M CULLUM, M D Lond

Late Assistant Resident Medical Officer Ham Green Hospital Bristol

By giving large amounts of alkalis in the course of an attack of scarlet fever Carter and Osman (1927) showed that a considerable reduction in the incidence of nephritis occurred in cases so treated compared with a control series. Peters (1932) brought forward evidence showing that the administration of thyroid and iodine for the first fortnight of an attack of scarlet fever was followed by a considerable fall in the incidence of nephritis.

Below is given a table showing the incidence of post scarlatinal nephritis in five-year periods during the past twenty five years in Ham Green Hospital.

TABLE I

Period	Total Cases of Scarlet Fever	Cases of Nephritis	Percentage Incidence of Nephritis
1910-14	2,771	53	1.92
1915-19	1,329	25	1.88
1920-24	2,496	63	2.5
1925-29	3,148	28	0.88
1930-34	2,427	9	0.37
1935-36	1,350	43	3.2

Thyroid and iodine were given during the period of 1930-4. Comparing the different incidence in the two periods of lowest prevalence it will be found that the difference is 2.3 times the standard deviation. The difference is very much higher if the whole twenty five year period is taken into consideration. On these grounds we were disposed to think that our method was proving effective, especially as 1930-4 figures include two cases which were admitted with nephritis already present in whom preventive methods had not been applied.

In the winter of 1934-5 a more severe type of scarlet fever appeared. It was characterized by a great increase of secondary attacks whilst in hospital by several second attacks in patients within a few weeks of discharge, by the increase of our return case rate to three times its normal number by an increase of all the more severe complications, and by the occurrence of attacks of scarlet fever in six Dick-negative reactors among the staff an event which had not occurred for many years.

In spite of administering thyroid and iodine, cases of nephritis cropped up with distressing frequency. We therefore investigated our method afresh using alternate cases as test and control. Table II shows the result of this investigation. By the term albuminuria is meant symptomless albuminuria for three consecutive days or longer. 'Nephritis' includes cases with signs or symptoms of renal failure. The observation of the sedimentation rate of the red blood corpuscles by Cookson (1926) working in this hospital suggests that there is a sharp line of demarcation between the two conditions.

TABLE II—*Series of Scarlet Fever Cases Treated with Thyroid and Iodine and Controls*

		Albuminuria	Nephritis
Test cases	165	34 (21%)	11 (6.6%)
Controls	162	26 (16%)	9 (5.5%)

It was evident that our method was having no beneficial effect in this type of scarlet fever. We therefore submitted another series of alternate cases and controls to Osman's method giving the alkaline mixture to the test cases in the doses he recommended continuously throughout the period of their stay in hospital, while the controls received alkalis for the first two days of their stay in hospital only. The results are shown in Table III.

TABLE III—*Series of Scarlet Fever Cases Treated with Alkalis (Osman's Method) and Controls*

		Albuminuria	Nephritis
Test cases	124	15 (12.1%)	5 (4.0%)
Controls	134	25 (18.6%)	6 (4.5%)

In this series it was also evident that no statistically significant improvement was being effected by Osman's method. On referring to Table I it will be seen that the incidence of nephritis was higher during 1935-6 than during any other period in the last twenty-seven years in Bristol.

Conclusion

It would appear that the various strains of streptococci causing the symptoms of scarlet fever vary greatly in their power of producing renal complications and that methods which seem to be effective in a controlled series of cases in preventing the complication of nephritis caused by certain strains may fail completely against other strains. A reliable means of preventing this serious complication which is effective against all strains of streptococci is still to be found.

R. B. Engelstad (*J Radiol Électrol* February 1937, p. 53) reports the results of radium therapy in fifty six cases of cancer of the buccal cavity. These included cancer of tongue, of the mouth proper and cancer of the gums. The treatment consisted of telradium therapy alone, or telradium therapy plus radium implantation plus electro-coagulation or of telradium therapy plus surgical operation. The curvical metastases were treated either by telradium therapy or by telradium therapy plus operation. The source of radiation for the telradium therapy consisted of a radium unit containing 2600 mg of radium element. The distance between the source of radium and the skin varied between 5.7 and 12.5 cm. Several fields were irradiated depending on the size and situation of the tumour. One field was treated each time and the dose varied between 3 and 6 Dominici units ($\frac{1}{4}$ to 2 hours) and a total of 50 Dominici units was applied. Skin and other reactions all cleared up in two to three weeks. The results of the treatment of the fifty six cases were as follows: 14 to 4 years cure twenty nine patients (53 per cent); cure after recurrence three patients; cured for the time being thirty two cases; alive but not cured four cases; dead twenty cases (36 per cent.).

CARCINOMA OF BREAST WITH WIDE-SPREAD METASTASES TWO CASES OF RECOVERY

BY

W. BARRINGTON PROWSE, M.R.C.S., L.R.C.P.
*Honorary Consulting Radiologist Royal Sussex
 County Hospital*

I venture to report these two cases in view of the extremely satisfactory results which followed treatment. Both were cases of mammary carcinoma in which wide-spread metastases had occurred, and both patients are now between one and two years after cessation of treatment, in good health and free from any sign of carcinoma. One of them had had no operation, as she did not present herself to a doctor until the disease was too far advanced for surgery, the other had had a radical amputation of the breast eighteen months before the presence of secondaries was discovered and treatment begun.

Case I

An unmarried lady of middle age was sent to me in August, 1934. There was in her right breast, adherent to the skin, a carcinomatous lump, which was broken and discharging slightly. There were secondary glands in the axilla and above the clavicle and also secondary deposits in several bones of the thorax and shoulder-girdle. Her general condition was very poor. I thought she was not fit for intensive x-ray therapy, and suggested that she should submit to a course of treatment by Todd's method. She agreed to this, and after some delay treatment was begun early in November. At that time she was entirely confined to bed and had to be brought by ambulance and stretcher for all x-ray treatment. She was wasted and had much pain, for which morphine had been necessary. She took food badly and was often sick.

On beginning treatment all morphine was stopped. She was given a weekly intravenous injection of compound colloid of selenium and sulphur, followed two days later by a mild dose of high-voltage x rays, a dressing of Paré's ointment (lead amalgam) was applied to the breast. It was found impossible to give her the calcium mixture recommended by Todd, she could not tolerate it and she only took radiostoleum and thyroid extract intermittently. Her veins were very small and there was considerable difficulty with the injections, which led to some delays and irregularity in the course of the treatment. Eventually the injections had to be stopped altogether—sooner than would have been the case under more favourable circumstances. The breast began slowly to improve not very long after starting treatment but otherwise there was no change, except some relief from pain.

In the early part of 1935 there was complaint of fresh pain in the lower part of the back and pelvic region, and radiographs revealed extensive secondary deposits in the spine and pelvic bones. The outlook appeared very gloomy but nevertheless treatment was continued. The one bright spot was the condition of the breast which by this time had vastly improved. I must pay tribute to the patient's perseverance and great tenacity of purpose. General improvement became evident at last in April 1935. Pain was much less and the sickness stopped. The appetite improved and before long the patient was eating more than she had done for years. In the middle of May she could sit up out of bed and on June 1 was just able to take a walk in the garden. No treatment was given between the end of July and the middle of October.

Her general condition was then quite good and she had put on a lot of weight the breast was quite healed and little or nothing could be felt of any glands. Pain was practically non-existent, and she was getting about freely. Radiographs, however, still showed extensive patches of rarefaction in the bones affected though there was some indication of fresh mineralization. I did not think it wise to attempt a further course of intravenous injections on account of the great difficulty experienced before, but I gave another course of high voltage x rays in moderate doses, covering the whole trunk and extending over a period of two months. At the same time she was able to take continuously a calcium mixture, radiostoleum, and small doses of thyroid extract.

There has been no treatment since December, 1935. The breast was then quite normal, apart from pigmentation of the skin near the nipple, glands were scarcely recognizable; and the patient's general health was good. She had put on 3 st in weight, and there was no evidence of any active disease, though mineralization of the old centres of disease in the bones was not yet complete. In spite of a severe attack of shingles, with varicella, in the spring of 1936 which kept her in bed for many weeks, there has been no recurrence of the carcinoma. I have seen her recently and found her in good health though complaining of being 'too fat'. There is no sign of any disease, and the bones have almost entirely recovered their density.

Details of Treatment

It may be well to give a summary of the treatment employed, with details of dosage and times of administration.

Between November 4 1934 and April 2 1935 intravenous injections of colloidal selenium and sulphur were given ('SSe' prepared by British Drug Houses). The initial dose was 2 ccm and throughout the course no single dose was more than 4 ccm. The injections were given every week except for an interval of three weeks between November 25 and December 17 one of a fortnight between January 29 and February 12, and one of three weeks between March 12 and April 2.

Two days after each injection x ray treatment was given. Usually two areas were irradiated at each sitting but some times only one. The dosage employed was somewhat variable but was always between 75 and 100 r to each area. The focal skin distance was 50 cm the kilovoltage 180 and the rays were filtered through 0.5 mm of zinc and 1 mm of aluminium. During April and the latter part of March when only one injection was possible, weekly dosage with x rays was continued and the dose increased to 120 r.

There was no treatment between April 17 and June 27. Then followed four more weekly injections of 'SSe' (4 ccm) with a dose of x rays (100 r) two days after each injection. No more selenium was given at any time after July 23 1935, and no other treatment at all until October 16.

Between October 16 and December 18 1935 sixteen applications of x rays were given. The whole trunk was irradiated being divided for this purpose into six areas and one area was treated at each sitting. The dose employed was 200 r at 200 kV. The focal skin distance was 50 cm and the rays were filtered through 0.5 mm of zinc and 1 mm of aluminium. Throughout this last course of x rays and for a fortnight afterwards the following medicines were taken:

Dry thyroid extract 1/10 grain once daily

Radiostoleum 6 drops twice daily

Mixture twice daily

Calcium chloride	gr 15
Sodium iodide	gr 5
Sol pectin	32
Syr implex	5 1/2
Aq dest.	ad 3 1/2

Case II

In September, 1932, a lady of middle age, with two children, had her right breast amputated for scirrhus carcinoma. In September, 1933 she had a hysterectomy for fibroids, and later I x-rayed her on account of severe pain and weakness in the left leg but found no cause in the spine or pelvis. A further x ray examination of the bones was made in London in January 1934 and this was also negative. In April, 1934, there was a sudden onset of pain in the lower thoracic region of girdle type. There was still much pain in the region of the left hip and pain also in the neck and right shoulder and in the region of the left ischial ramus. Again an x ray examination was carried out and I found secondary carcinomatous deposits in both ilia in the left ischial ramus in the fifth and sixth cervical and the fourth and fifth lumbar vertebrae, and, lastly, a doubtful spot in the ninth dorsal vertebra. All movements were painful, and the patient had to be brought for examination by ambulance and stretcher.

It was decided to give high voltage x ray treatment for the relief of pain and in the hope of promoting local healing. This was carried out in May, and all the bone lesions were treated with the exception of one small spot in the right ilium. Massive doses were given but no lesion was irradiated through more than two fields.

In June there was considerable improvement, pain was much less and her general condition better. She was able to walk a very little. In August she was a great deal better, had no pain, and was walking well. In September an x-ray examination showed all the bone lesions healed and well mineralized, with the exception of the small one in the right ilium which had not been irradiated.

In order to carry on the good work and if possible to complete the 'cure,' it was agreed that it would be well to give a course of treatment by Todd's method. The patient and her husband were willing and treatment was accordingly begun early in September 1934. Weekly intravenous injections of the compound colloid of selenium and sulphur were given, followed two days later by mild applications of high voltage x rays. This was continued for six weeks, and then the x rays were stopped and a radio-active colloid was alternated with the selenium and sulphur colloid, week by week, until December 11. The veins were difficult to inject, and sometimes there was trouble with rigors and vomiting after the injections.

The patient went away in December for a month's holiday at Newquay, and on her return the alternate weekly injections were started again. Seven were given up to March 19, 1935, but she has had none since. There was continuous increase in weight from September—in one week as much as 5 lb was gained—and on February 19 1935 her weight was 11 st. 3 1/2 lb., which represented a gain of about 3 st. During the treatment the patient did not have the medicines recommended by Todd. X-ray examination after the course showed all the old lesions still healed and also the one in the right ilium.

In March 1936 a year after cessation of treatment a small rarefied spot was discovered in the seventh rib on the left side. This quickly cleared up after two applications of high voltage x rays (200 kV) with a total dose of 800 r. Since then no evidence of carcinoma has been discovered. The patient has led a normal life.

Details of Treatment

Between May 4 and May 25 1934 six applications of x rays were given. All diseased areas of bone received treatment except the small one in the right ilium. On each occasion a full erythema dose was given but no lesion was irradiated through more than two fields. The focal skin distance was 40 cm and a current of 3 mA at 200 kV was employed.

Between September 4 and October 11, 1934, the patient had six weekly intravenous injections of colloidal selenium and sulphur. The initial dose was 2 ccm, all the others were 4 ccm. A ray treatment was given two days after each injection. One or two areas were irradiated each time, and received 100 r at 200 kV from a distance of 50 cm. All diseased areas of bone were treated. On October 16 4 ccm of "SSe" were injected but no x rays were given afterwards.

From October 23 to December 11 alternate weekly injections of RAS (radio active selenide) and "SSe" were given. The initial dose of RAS was 1½ ccm, but later doses were graduated up to 5 ccm. The dose of "SSe" remained at 4 ccm. There was similar alternation of SSe and RAS between January 23 and March 19, the doses being 4 ccm and 5 ccm respectively.

After this no further treatment was given except the two doses of x rays on March 31 and April 1 1936 already mentioned. Each dose was 400 r at 200 kV, and the focal skin distance was 45 cm. Medicines were not administered.

Commentary

In the application of radiation for the treatment of cancer it is generally accepted that there must be two main objectives: (1) the administration, at suitable intervals of time, of sufficient x rays to all parts of the growth to produce a lethal effect on the cancer cells; and (2) the control of irradiation of the surrounding tissues so that their vitality shall not be destroyed or unduly depressed. It would seem, from a consideration of the two cases quoted and of others on record, that there are other factors in the re-establishment of normal conditions which do not depend entirely on a primary lethal effect on the cancer cells and that there is room in our practice for a method of attack in which the prime object of irradiation is not the *direct* destruction of the vitality of these cells.

In neither of these cases was the radiation given in sufficient quantity to ensure such an effect, and in Case I, at any rate, the extent and distribution of the lesions and the condition of the patient prohibited heavy dosage. In Case II although massive dosage was first employed and had a very beneficial effect on the lesions treated it was given primarily for the relief of pain and hardly in sufficient quantity to ensure a lethal effect on the deep-seated lesions. Moreover, one small metastasis in the right ilium was not treated at all the first time, and was still present four months later when treatment with selenium and small doses of x rays was begun, it quickly cleared up under this. Case I was in an extremely advanced stage when treatment was begun; the patient had in fact been told before I saw her that she had probably only three or four months to live. In any event her condition was such that I should have refused to attempt any treatment by heavy x ray therapy.

Todd looking upon cancer as an infective disease, bases his method on the natural though insufficient resistance of the patient and holds that his treatment acts by stimulating the patient's defensive mechanism and improving his general condition. Whether or not this is a full or even a true conception of what occurs, the fact remains that there have been some remarkable

successes with most unpromising material. The avoidance of very heavy dosage by x rays or radium, with its attendant dangers and often depressing effects, is surely one great advantage of this method of treatment. Another is that it can be employed, with the possibility of some success, even in very advanced cases which ordinarily would get nothing beyond palliative and pain-relieving treatment. One obvious disadvantage is the necessity for repeated and frequent intravenous injections. These have to be well controlled and given with great care, and difficulties are apt to arise in connexion with the veins, especially when they are small. Everything considered, it would seem that the method can be looked upon as a useful addition to the means of dealing with cancer.

Clinical Memoranda

Recovery from Streptococcal Meningitis After Prontosil

After reading Dr Christia F Lucas's account (*Journal March 13 p 557*) of a case of streptococcal meningitis successfully treated with prontosil, I feel that the following report of a somewhat similar case may be of interest.

CASE REPORT

A youth aged 17 was admitted to hospital on November 6, 1936 having fallen down a lift shaft from the fourth floor to the basement. He showed clear clinical signs of a fracture of the anterior fossa of the skull—profuse bleeding from the nose and subconjunctival ecchymosis of the right eye. There were no other injuries; the pulse rate was 84 and although there was a history of a few minutes unconsciousness he was already conscious though somewhat irritable on admission.

The patient made good progress and was regarded as practically convalescent when, on the morning of November 13 his temperature rose to 102 F and the pulse rate fell to 68. He was drowsy and complained of pain behind the eyes. There was slight head retraction and Kernig's sign was positive. On lumbar puncture turbid fluid which was under slight pressure was withdrawn; it contained hundreds of polymorphonuclear leucocytes but no organisms. Culture was sterile and the chloride content 650 mg per 100 ccm of fluid. The next day he was quite comatose and incontinent of urine and faeces. Lumbar puncture was repeated with identical findings.

By November 20 the pulse rate had fallen to 48, feeding was practically impossible and the patient's general condition was pitiable. A third lumbar puncture was performed and this time streptococci were found on direct examination. An intravenous injection of 20 ccm of prontosil soluble was given at once and repeated in eight hours. That evening his temperature was 98 F and pulse rate 64 and he took fluids freely. Culture confirmed the presence of a haemolytic streptococcus, and treatment was continued with prontosil album by mouth and two tablets thrice daily. There was no further rise of temperature and he improved rapidly in every way. The prontosil was stopped on November 29 by which time the patient appeared perfectly recovered; there were no signs of toxic effects from the drug. He was discharged on December 4. When he reported three months later there was no evidence of mental deterioration and he was in excellent physical condition, the sole stigma of past illness being a slight ptosis of the right eyelid.

I am indebted to Mr Howard Stevenson F.R.C.S. senior surgeon to the hospital for permission to publish this case.

Royal Victoria Hospital Belfast.

Reviews

THE MEDICAL ANNUAL, 1937

The Medical Annual Fifty fifth year 1937 Edited by H. Letheby Tidy M.A., M.D., F.R.C.P., and A. Rendle Short, M.D. B.S. B.Sc., F.R.C.S. (Pp 704 illustrated 20s net.) Bristol J. Wright and Sons London Simpkin Marshall 1937

A reviewer who can find errors of fact, careless proof-reading, poor illustrations, a point of view with which he disagrees, usually has little difficulty in spinning out four or five hundred words to a notice of a book. If he finds little to criticize he may content himself with a description of what is in the book, or vigorously take sides with the author in advocating a policy or theory which they both have at heart. There is, however, little to criticize in the *Medical Annual* so thoroughly have the editors and the publishers done their work in presenting to medical readers their ever welcome review of medical progress during the past year. Nor is a description of the contents possible, for here is surveyed the whole field of medicine and surgery.

Among much that is of value to both the general practitioner and the specialist it is perhaps ridiculous to single out this or that article, but the accounts given by Dr. Macdonald Critchley of the psychology of van der Lubbe, who played such a dramatic part in the burning of the Reichstag, and of "punch drunkenness" are of special interest. It was the fear of becoming "punch drunk"—or "goofy," "slap-happy," "slug nutty" (to give a few synonyms, not forgetting the more elegant "traumatic encephalopathy")—that led to General Tunney's retirement from the ring. Also of interest is the well-written section by Mr. D. Harcourt Kitchin on 'Legal Decisions and Enactments of Recent Date', in the introduction it is stated, 'Readers will undoubtedly welcome the intention of the editors that this shall be an annual article.' Among the illustrations we note those of the Kettering hyperthermia, of the radium bomb teletherapy apparatus, and of Chaoul contact radiotherapy—illustrations of things many readers have heard about but not seen—but we cannot see the reason for including the plate entitled "Treatment of Surgical Shock," unless it is to prove that surgeons can remain in a state of masterly inactivity.

Although the *Medical Annual* sets out to give a summary of 'medical activities,' it confines itself largely to clinical and scientific medicine and devotes little space to what might be called public medicine. The editors refer to the highest importance of preventive medicine, the progress of which they say, is reflected in the various articles in the *Annual*. There are too sections on Food and the Public Health and on Industrial Diseases. Nevertheless more space might be devoted to movements and matters directed to the betterment of the public health: a yearly review of these and of such aspects of public medicine as national health insurance (of concern to some 16,000 medical men), contributory schemes, public medical service schemes etc., would we believe make the *Medical Annual* more truly a survey of medical activities.

A review of the Addendum to the *British Pharmacopoeia* published by the Pharmacopoeia Commission of the General Medical Council, will be found immediately preceding the alphabetical lists of preparations and appliances. A new feature of the present issue is that the general index is now placed at the end of the book.

PRACTICAL PHYSIOLOGY

Human Physiology A Practical Course By C. G. Douglas, C.M.G., M.C. D.M. F.R.S., and J. G. Priestley M.C. D.M. Second edition (Pp 229 32 figures 12s. 6d net) London H. Milford, Oxford University Press 1937

It is now some twelve years since the first edition of this work appeared. Although it was intended to give an account of the practical course in human physiology developed in Oxford, and therefore presumably used principally by students attending that course, the book contained so much that had emerged from the fundamental researches of the Oxford school that, for particular sections, teachers felt that no better descriptions could be found. Since the publication of this first edition other books with a similar object in view have become available; but there was a certain simplicity and clarity about the description of experiments and precautions of all kind as presented in 'Douglas and Priestley' which allowed it to retain a strong position for certain aspects of the subject, notably respiration, respiratory exchange, and the blood gases. In the new edition alterations have been introduced tending to increase the usefulness of the book for practical classes. The influence of Haldane is manifest in the major part of the work, and it is praise indeed to be able to say that the book is a worthy tribute to the master. By restricting the work to operations which are to be carried out on the human subject the clinical aspect is kept constantly before the mind and there can be no doubt that the student who has followed the course prescribed will be in an excellent position to apply sound physiological reasoning to his clinical problems.

ON THE PRACTICE OF MEDICINE

Medical Modes and Morals By Harry Roberts. With chapters on Doctors and Patients in the Past by Margaret Jackson (Pp 255 7s 6d net) London Michael Joseph 1937

Dr. Harry Roberts has here collected a symposium of reflections on the practice of medicine, based on forty years' experience of the profession. Dr. Roberts is especially fitted to write a book of this nature. In the course of thirty years of active practice in the East End of London he has been in a position to observe not only the trends and developments of modern medicine, but also the remarkable changes both of environment and of mental outlook, which have affected the working classes during that period. The appalling conditions existing in the East End in the first years of the present century are apparent from a description of one of Dr. Roberts' earlier confinements. The patient shared her dirty bed with a three-year old child suffering from pneumonia. On a palliasse in another corner lay the body of a one-year old child who had died two days before from the same disease, while the unfortunate mother admonished another child of 5, playing in the room, to refrain from fingering the corpse. Hundreds of similar confinements were attended with the co-operation of "the direct descendants of Mrs. Gamp." Nevertheless it is surprising to read that the proportion of maternal deaths was negligible while puerperal sickness was not at all frequent. Cultural handicaps were even greater than the material. The street corner and the public house were the only alternatives to the overcrowded single room. Although the overcrowding still persists the advent of the cinema, the dance hall, and the wireless has provided a wider and happier outlook. The inferiority feeling from which the working-classes suffered through force of circumstances

has now disappeared. This is especially noticeable among the younger women who in Dr Roberts's opinion, compare very favourably with their more fortunate sisters in the West End.

The author contrasts the revolutionary improvement in surgical practice since the advent of asepsis from the point of view of safety, with the lamentable morbidity and mortality rates still persisting in midwifery. Why has asepsis failed to show a beneficent influence on obstetrics? Dr Roberts attributes this to the lack of obstetric skill in emergencies on the part of the modern practitioner, due simply to the fact that, under present conditions, he has not the opportunity of gaining the necessary experience. Until wholesale hospital midwifery becomes a matter of practical politics Dr Roberts suggests a revival of the better features of the old apprenticeship system as a means of providing the mass of general practitioners with the requisite obstetric skill. The author states his views on many other professional questions. They are valuable in that they are deduced from the personal observation and experience of a man of unusually broad outlook, uninfluenced by textbook teaching or the therapeutic vogues of the moment.

The last fifty pages of the book are devoted to chapters on 'Doctors and Patients in the Past' by Dr Margaret Jackson giving a concise historical survey of the profession from prehistoric times—a series of admirable vignettes.

CUNNINGHAM'S ANATOMY

Cunningham's Textbook of Anatomy. Edited by J. C. Brash M.A. M.D., F.R.C.S. Ed. and E. B. Jamieson M.D. Seventh edition (Pp. 1,506. 1171 figures (653 in colour). 76 plates. 42s. net.) London: H. Milford, Oxford University Press, 1937.

The seventh edition of Cunningham's classical *Textbook of Anatomy* has been brought out under the able superintendence of Professor J. C. Brash and Dr E. B. Jamieson and maintains the lucid character which was impressed on it by its first editor and has been continued for nearly twenty-five years by Professor Arthur Robinson who, though still taking an active interest, has now retired from the editorship. We are glad to have this opportunity of expressing our appreciation of the high standard of his work and also that of Professor J. T. Wilson who likewise has retired. Two distinguished members of the editorial staff, Professor Francis Dixon of the University of Dublin and Sir Grafton Elliot Smith of University College, London, have died; their names will live on for many years in the memory of British anatomists. Among the new contributors are Professor A. B. Appleton (ductless glands) and Professor R. D. Lockhart (myology). Illustrations have been added in all sections of the book and special attention may be drawn to the excellent drawings by R. W. Matthews and A. K. Maxwell and also to the photographic illustrations and the radiographs which give additional interest to a publication that has always held a high place in the artistic representation of anatomy. Space will not allow mention of all those who have contributed new photographs and radiographs but we feel that Professor Lockhart's deserve special recognition not only for their originality but for the fresh light they shed on the problems of movement in the living subject as contrasted with the fixed anatomy of the dead. An important change is the adoption of the nomenclature approved by the Anatomical Society of Great Britain and Ireland at the Birmingham meeting in 1933.

By way of constructive criticism of an admirable book we should like to see inserted in the appropriate places

some clear-cut illustrations of the microscopical structure of these organs and tissues which are important from the practical standpoint. For instance sections of human embryos showing typical stages of organogeny, blood lymph corpuscles, and red marrow, the development of bone, the various types of muscle, the tonsil, the fully developed thymus, lung tissue, the pancreas, including islets of Langerhans, the testis, showing tubules and interstitial cells, a corpus luteum of pregnancy, the uterine mucosa and decidua, the mammary gland in the resting and active conditions, typical areas of the cerebral cortex such as the motor, hippocampal, and visual, with a short description of the evolution of the cortex. In our opinion such drawings made from actual specimens are much more satisfactory than diagrams of an artificial nature which though perhaps more simple may be misleading. For example, Fig. 89 purports to represent the separation of the placenta but shows a mode of detachment that, if it were true, would be dangerous, and might lead to fatal haemorrhage. The book as a whole is, however, a masterly exposition of what a medical student or practitioner would wish to possess as a textbook of human anatomy or for reference.

HISTORY OF THE ZYMOTICS

The History of the Acute Exanthemata. The FitzPatrick Lectures for 1935 and 1936. By J. D. Rolleston M.A. M.D., F.R.C.P., F.S.A. (Pp. 114. 7s. 6d. net.) London: W. Heinemann, 1937.

Modern statistical logicians have less faith in the rule of succession than did Laplace, and certainly authors who have written many good books may write bad ones. But it will be a reasonable exercise of faith to hold that any book bearing the honoured name of Rolleston is valuable. Dr J. D. Rolleston's FitzPatrick Lectures confirm that faith. Scholarship and clinical experience are a rarer combination than in the past; Dr Rolleston has the good fortune to illustrate the value of historical learning to the clinician and medical experience to the scholar. In this short, perhaps too short, volume he records the vicissitudes of small pox, chicken-pox, scarlet fever, measles and German measles, and of medical opinion respecting these illnesses.

Dr Rolleston writes with judicial impartiality. On the once-exciting controversy as to whether small pox was known to the physicians of classical antiquity he contents himself with summarizing the arguments. Perhaps his summary of Haeser's view is a trifle too condensed. The reader might suppose that Haeser put much weight upon the fact that many early medical writings which might have contained unequivocal accounts of small-pox were lost. To us Haeser's main argument appears to have been this: That some clinical descriptions by Galen and others could, without too much ingenuity, be taken to apply to cases of small-pox, and that the admitted rarity of well-described epidemics might partly depend upon the loss of writings, but also upon a genuine infrequency of epidemics in the West earlier than the sixth century.

Dr Rolleston's chapter on chicken pox enables us to get the history into true perspective. Many of us have supposed that the elder Heberden was the first physician to recognize the essential difference between small-pox and chicken pox. Dr Rolleston while giving due credit to Heberden points out that he had predecessors and that after his time competent physicians again confused the issue—no uncommon event in the history of the zymotics. The history of scarlet fever is so dramatic that it is good copy for any historian. Dr Rolleston naturally tells the story well. It is interesting to learn that the

acute Fuller did not believe scarlet fever to be contagious. In his chapter on measles Dr Rolleston describes Home's pioneer experiments in inoculation. He notices that, in spite of Sydenham measles and scarlet fever were confused almost to the end of the eighteenth century. He includes an account of the not too well known modern instance of virulent measles in a population without experience of the disease. The case of the Highland Division quartered in Bedford in 1914-15 is of interest. There were 529 cases with sixty five deaths, mostly due to septic bronchopneumonia. The disease was most severe among men from the remote Highlands. The final chapter deals with German measles, the general recognition of which dates from 1881. All modern writers with extensive experience are unanimous as to the almost invariably mild course of this disease.

This clearly written book is worthy of its author and of the series in which it appears.

Notes on Books

As a practised writer of crime thrillers Mr ANTHONY WEYMOUTH realizes the importance of arresting the reader's attention from the outset. In the first eight pages of his autobiography, *Whod Be a Doctor?* (Rich and Cowan, 8s 6d) which reveals the author as a West End practitioner, a woman patient commits suicide by throwing herself from the third floor window of a nursing home, and three spectators of the Derby are struck by lightning, one fatally, before the end of the chapter a woman swallows the large blade of a penknife. The book then settles down to chronological order, with an excellent description of student life at St Thomas at the beginning of the century. A provincial house appointment follows enlivened by the periodical arrival at the hospital of a four wheeler bearing a case of delirium tremens. The author showed his wisdom by viewing practice from every angle through a variety of locum-tenencies described with considerable humour before setting up in London. Here he rapidly established a successful practice, which became still more lucrative as circumstances and inclination induced him to specialize in neurasthenia. The book is full of amusing anecdotes, both of patients and of doctors and there are many wise observations on diagnosis and treatment. Mr Weymouth writes with a pleasing modesty and shows that he possesses a broad and philosophical outlook on medicine and on life in general. The author's frequent references to his happy family circle are attractive (and unusual) features of this very readable book.

A new edition of *Nursing Homes* (Benn Brothers 4s) has made its appearance. The number of pages this year extends to 280 and the information it contains arranged under counties has been obtained either from the nursing homes direct or from responsible official sources. This volume continues to meet a definite need since it is the only yearbook of its kind covering Great Britain.

Période de Fécondité et Périodes de Stérilité Chez la Femme by H VIGNES and M ROBÉY (Masson et Cie 14 fr) has as its main theme the safe period postulated by Ogino and Knaus. Experimental work suggests that ovulation occurs within a set and limited period of the menstrual cycle and that human spermatozoa can only live for a short time in the female genital passages and therefore that a woman can only conceive during at most one week out of every month. Clinical evidence, on the other hand would appear to offer irrefutable evidence that conception may take place on any and every day of the menstrual cycle. Dr Vignes and Robéy, both clinicians are fully conversant with the scientific literature and are at the same time able to evaluate the vast amount of relevant clinical data which has accumulated.

They conclude that the period of fertility is very circumscribed in the great majority of women, but that in some 20 per cent there is no safe period. We know of no better or more concise exposition of this vexed question.

The third edition of *The Preparation of Scientific and Technical Papers* has been produced by SAM F. TRELEASE and EMMA SAREPTA YULE (Ballière, Tindall and Cox 7s). This manual has been designed to help those who have to write university theses and should enable them to present their material in the most effective form. Though primarily intended for students, the handbook should prove of value to medical men in the preparation of technical articles. Much of the material submitted to scientific journals is badly arranged, this defect often spoiling otherwise good work and thus lessening its chances of acceptance. The information contained in the handbook, properly applied, should assist in the production of a well-balanced paper, and the result thus be less likely to prove a source of tribulation to a busy editorial staff.

Mr GEORGE RYLEY SCOTT's work on *The Sex Life of Man and Woman* (Werner Laurie 10s) claims to be an introduction to the sexual problem not only for the lay public but also for the medical profession, of which he is not a member. The book deals in a popular manner with the anatomy and physiology of the sexual organs, masturbation, venereal disease, impotence, sterility, and birth control. We have noticed a number of verbal errors, such as labias (pp 19 and 21), sine immissio (pp 184, 302, and 311), haemophylic (pp 201 and 304), and pruritis (pp 279 and 316).

Preparations and Appliances

MOBILE LIGHT TREATMENT UNIT FOR WARD WORK

An advance in actinotherapy equipment is the introduction by Hanovia Ltd of Slough of a ward model lamp for light treatment, an easily transportable unit which can be brought to the patient's bedside. The arc lamp with its reflector and hood and the electrical controls are mounted on a small trolley which runs smoothly on ball bearing rubber tyred castors and is so compact and mobile that it can be taken along any corridor through any doorway and into any lift or small room. The ultra violet rays are generated by a mercury arc operating in a U shaped tube of transparent quartz. A parabolic adjustable reflector will in one position diffuse the actinic rays for general treatment and in another concentrate the beam for focal or regional irradiation with threefold intensity. By means of an extension arm and fork bracket the lamp can be swung right over the cot and be operated in any desired position without moving the patient. The unit has the further advantage that it can be connected to any light socket or pendant by means of a universal plug. A timing clock is provided which marks any treatment interval up to thirty minutes and gives a ringing signal when irradiation is finished. From three to five patients an hour can be treated. The great value of the unit is that it makes possible the administration of light treatment at an earlier stage in recovery after operation or other illness. As matters have stood the time for light treatment has often been dictated not by the patient's need for it, but by his ability to go or be taken to the light department. There should be a wide field of application for this new design. The model can be inspected at the firm's London showroom, 3 Victoria Street SW 1.

WHOOPIING COUGH VACCINE

Wellcome brand whooping-cough vaccine (Burroughs Wellcome and Co) is put out by the makers with certain reservations. They point out that there is at present no satisfactory laboratory test for potency. They quote clinical reports favourable to the value of this vaccine as a prophylactic agent, but conclude that so far there is no general agreement as to the efficacy of the vaccine in the treatment of whooping-cough. There will however be general agreement with their conclusion that the disease is such a nuisance and is often so severe that any promising prophylactic measure is worthy of trial.

RURAL HEALTH IN THE SOUTHERN STATES

In the beginning of the seventeenth century certain English people crossed the North Atlantic under the aegis of a corporation known as the London Company. Settling first at Jamestown in Virginia they spread from there towards the west over territory which now forms part of the Southern States of the Union. These planters, as they came to be called, had left home in order to advance their fortunes and not out of any grievance against their native land, and the methods of government which they adopted in their new surroundings were those of the England of their day, where the county and not the town was the recognized administrative unit. A little later in the same century, when the Plymouth Company received its privileges other English settlers of a different temper took ship to Massachusetts, and moved westward also. These colonizers of the northern belt had broken away from the Church of England. Being independents, they thought in terms of separate congregations and tended to cluster round their churches. For these reasons, and also because they had no inclination to copy English ways of administration developed in their hands on an urban and not a county basis.

This difference between the northern and southern belts has shown a strong tendency to persistence, with the result that at the present time county government as understood in America is still exemplified most typically in the south and not the north. Administrative life in many southern counties is one of primeval simplicity. The official stands very close to his people. No difference of status lends distance or enchantment to his position and the average citizen feels entirely at liberty to call him in question personally at every turn. A medical officer assuming duty in one of these young communities, when in seeking to organize health movements he finds his progress barred by unreason may well wish for guidance not only on the professional aspects of the position but also in the more difficult art of managing his fellow creatures.

Guidance by Experience

Guidance for the rural medical officer under such conditions is furnished in a recent work by Professor Harry S. Mustard of the Johns Hopkins University¹ who, having himself had experience of rural health practice, modestly claims to have made most of the mistakes which it is possible for a rural health officer to make. He writes against the background of his own southern experience, which adds weight and value to what he has to say. Keeping in mind the fact that the rural medical officer is to a large extent cut off from recourse to libraries, he details in a tactful manner some of the clinical tests now current in public health work. He reminds his reader how to carry out the Schick test, how to make the Mantoux test which he considers the method of choice among tuberculin tests, and how to enter the spinal canal. He discusses the question of suitable quarters to house the medical officer and his department, whether at the County Buildings or over a store in the main street or in a residential block. In the matter of records and reports he is minutely and even paternally helpful. He devotes close on a page to the family folder which is a folded card destined to contain the health records of the members of a family, pointing out that if the fold breaks through it is better in the long run to use a new folder than to provide a new hinge of course be entered in the new. Turning next to the tabulation of statistical material he warns his reader against the blunder of trying to convey too much in a

graph. He expresses dislike which many will share for complicated diagrams designed to reveal the interrelations of sections of a health department which by means of their "suspended circles hanging triangles, and converging lines" obscure a situation which, simply stated would have been plain enough.

His article on statistical procedures is admirable in its conciseness and lucidity. Beginning with the centring constants he passes on to probability calculations, and finishes up with the Chi square test, remaining throughout within the understanding of the intelligent non-mathematical reader.

Apart from the reasoned sequence of Professor Mustard's work his more general observations upon the world of health as he has found it are lively and instructive. We cite a few. "It is seldom that rural health departments are developed solely through local interest. 'Public meetings are not to be entered into without some previous preparation and stage setting.' 'To inform some men that the maternal mortality rate is 7.5 maternal deaths per 1000 live births causes them only to wonder how one half a woman might die.' 'A low standard of work by a health officer should be sufficient for his removal from office.' The dollar equivalent method of appraisal of health department service is a poor procedure. 'The following up of the nurse on the individual child is one of the least productive things in the school health programme.' 'Midwives in the United States are all much alike, except that some are worse than others.' 'The pasteurization of clean milk is the sheet anchor in milk sanitation.'

Through the whole of Professor Mustard's writing runs a strong vein of common sense, which is, after all, to borrow his own expression, the 'sheet anchor' of public health administration, whether rural or urban.

W. F. Wenner and J. H. Alexander (*Arch. Otolaryng.*, Chicago, December, 1936, p. 742) find that changes in the nasal mucosa following zinc ionization do not hinder the absorption of vasomotor drugs instilled into the nasal cavity. The changes after zinc ionization consist of coagulative necrosis and desquamation of the surface epithelium. The surface then becomes covered with stratified epithelium, and this gives rise again to normal ciliated columnar epithelium within two to three months. The turbescence of the mucous membrane and the rhinorrhoea in allergic rhinitis clear up after intranasal ionization. There are two ways in which one can explain the relief of symptoms: (1) Changes in the epithelial lining have affected the rate of absorption of substances introduced into the nose. (2) Disturbances of the nervous vasomotor mechanism have been brought about by the process of ionization. Any agent that would interfere with the vasodilator nerves would produce symptomatic relief without necessarily altering the state of sensitivity. The authors experimented on cats in order to put these views to a test. Under anaesthesia the left side of the nose was filled with zinc sulphate solution and a current was allowed to flow for twenty minutes. In another group of cats a physiological salt solution was used instead of the zinc sulphate and a current passed in the same way. At intervals varying from one week to three months the animals were again anaesthetized, and tracheal and carotid cannulae were inserted for recording respiration and blood pressure. The choanae were then blocked with post-nasal plugs and various vasoconstricting and vasodilating agents were instilled into either the right or the left nostril. Histological preparations of the nasal mucosa show that the blood vessels and cavernous tissue fail to react to vasoconstrictor and vasodilator substances for six weeks after zinc ionization and for four weeks after treatment with the galvanic current alone. This failure of the vascular structures to constrict or to dilate is due either to a temporary paralysis of the vasomotor nerves or to a loss of vascular tone.

¹ *Rural Health Practice* by Harry S. Mustard, M.D. New York: The Commonwealth Fund. London: H. Milford Oxford University Press. 17s.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY MAY 15 1937

THE CORONATION

When these words appear in print on Friday there can be little left to say about the Coronation. The newspapers and the radio stations are working overtime, and full details of the great ceremony of Wednesday, May 12, will be known to our readers in every part of the world. One backward glance, to an earlier Coronation, may therefore suffice.

In the early summer of 1838—when the British Medical Association was six years old and bore a longer name and its *Journal* had not yet come to birth—Queen Victoria drove to Westminster Abbey to be crowned. "It was a fine day, and the crowds of people exceeded what I have ever seen. Their good humour and excessive loyalty was beyond everything, and I really cannot say how proud I feel to be the Queen of such a Nation. The enthusiasm, affection and loyalty were really touching, and I shall remember this day as the *Proudest* of my life!" It was a memorable and glorious day for me. I likewise venture to add that people thought I did my part very well." So wrote the young Queen of England ninety-nine years ago. And history, we hope, will have repeated itself in all these particulars for her great-grandson on May 12, 1937. Our weather is capricious, but the affection and respect that supported Victoria from the day she came to the throne to the end of her long life can be counted upon by George VI. The ceremonies still follow the ancient ritual, but the plans and preparations this year have been more elaborate than for any earlier Coronation, even that of 1911, and the strain on those responsible is proportionately heavier.

Without further ado we offer congratulations to our King and Queen at this time of national rejoicing and wish them many years of happiness and good work, in the name of the 36,000 medical men and women who make up the British Medical Association to-day. King George VI, like his grandfather, his father, and his eldest brother before him, has honoured the Association by becoming its Patron. The members, scattered throughout the British Empire and beyond, join with their fellow subjects in a loyal toast to His Majesty

VOLUNTARY HOSPITALS

The Voluntary Hospitals Commission set up by the British Hospitals Association which began to collect evidence some sixteen months ago, has now issued its report,¹ and an account of the report was given in last week's *Journal* at page 984. It is a useful document which deserves, and will no doubt receive, careful consideration by all those interested in the work of the voluntary hospitals. If the members of the Commission can scarcely be regarded as thoroughly representative, they constitute a team competent to give, within their terms of reference, a valuable judgement on the matters remitted to them from the aspects of medicine, nursing, the law, administration, and finance and accountancy. The report is signed by all the members without reservations, so that the opinions it expresses and the advice it tenders should be regarded as having much weight and some authority. It does not profess to cover the whole field of hospital problems, it touches only lightly on the relation of voluntary to council hospitals, and while there will be readers who may think that some matters discussed might well have been left for the consideration of the Central Hospital Council, whose formation is one of the chief recommendations, there will be others who may wish that certain of the questions raised had been carried to a more complete conclusion even before their consideration by such a council. For the painstaking sifting of a large volume of evidence and the orderly presentation of conclusions, the Commission deserves thanks.

The report sets out quite definitely the opinion that the continuance of the voluntary hospitals is highly desirable, but that this continuance of their existence will be precarious in the absence of co-operation and organization by them in the field which they cover. These are blessed words but they do stand for important actualities. Though the annual revenue of the voluntary hospitals, taking them all together, at present considerably exceeds their annual expenditure the former is uncertain and the latter is bound to increase and there can be little doubt that unless as a whole these institutions show themselves willing to abandon much of the isolation and individualism to which they have clung obstinately for so long all but a very few which are specially favoured or endowed will find it very difficult or even impossible to survive for many years. The course not only recommended but regarded as essential is a voluntary grading and grouping and regionaliza-

¹ London. The British Hospitals Association, 12, Grosvenor Crescent, S.W. 1 (1s post free 1s 2d)

tion for a large variety of purposes. The grading into central, district, cottage, and auxiliary hospitals, defined in the report in a manner now generally understood, the grouping of a considerable number of hospitals of these several grades round one large hospital fully equipped and staffed for almost all kinds of medical and surgical work, the recognition of the area which such a group of hospitals serves as largely a self-contained region which their activities would cover in common, from which in great part they would derive their revenue, and to which in the main they would direct their appeals for support—these things are urged very strongly upon the numerous boards of management. For each such region and representative of all the hospitals within it, there should be a regional council which would by no means supersede the individual governing bodies, but would enable them collectively to give a more efficient service, to effect considerable economies, and to avoid overlapping appeals for funds and unnecessary or ill-placed future hospital provision. The report sets out with some fullness the organization and duties of such a council but does not touch on two relevant matters of great importance.

What is to be the relation of these organized groups and councils to the hospital work of the Local Government authorities? On what principles are the regions themselves to be mapped out? The absence of more definite guidance as to the best answers to these necessary questions leaves the report relatively unhelpful but one can understand it. The Commission was appointed by a voluntary body and its reference was to voluntary hospitals only. The volume of work within this reference was already large and the Commission had therefore neither the time nor the authority to go much further than it has gone into the statutory powers or duties of local authorities, or to suggest in more than very general terms the desirability of co-operation between the two sets of hospitals and of representation of the local authorities upon the regional councils which the voluntary hospitals might form. Again the actual mapping out of the country into definite hospital regions could scarcely have been expected but the Commission might perhaps have gone more fully into the questions immediately arising with regard thereto. Almost all that is said is that the regions "should be built up in accordance with the position, rank, and size of hospitals and should have regard as far as possible, to the areas of local authorities with which they will co-operate." That is poor material for any adequate discussion of this very important matter. The British Hospitals Association has at present a regional organization and there are several

schemes of group hospital work now operating, but these are all admittedly imperfect or experimental. It is possibly wise of the Commission merely to indicate the way in which this question might be further explored, but a fuller discussion in the report would have been welcome. The success of the whole plan will depend upon the care and tact with which individual hospitals are approached, and, in the long run, on the degree to which the organized regions can be made either directly or, by ingenious arrangements within the organization, to correspond with Local Government areas or with combinations of such areas.

The formation of a Central Hospital Council co-ordinating the work of the several regional councils is a corollary. This is recommended, and an indication, sufficient for the moment, is given of its nature and duties. We are glad to note that on other matters of importance the Commission is in general agreement with the policy advocated by the British Medical Association. Among these may be mentioned the "open staff" for cottage hospitals, the provision of pay-beds and the access thereto of medical practitioners other than the staff of the hospital to which they are attached, the restricted use of out-patient departments, the principle of the payment of visiting medical staffs, an income limit for members of contributory schemes, and the organization of such schemes on an insurance rather than on a charitable basis. It is true that in some of these matters with which the medical profession is specially concerned the Commission sees difficulties in their immediate and universal application, but so does the British Medical Association. Yet it is a distinct advance towards the accomplishment of the Association's policy that in principle, and to a great extent in detail too, this policy should thus have received the endorsement of an impartial and independent authority.

CONGRESSES OF OBSTETRICS AND GYNAECOLOGY

It is scarcely a hundred years since obstetrics and gynaecology began to develop into a separate and distinct branch of medicine. In recent times the field of obstetrics has become enlarged and to day it is recognized that eugenics, sociology, and even the survival of the race are problems which are closely related to and deserve the careful consideration of those engaged in obstetrics. The American Committee on Maternal Welfare has been instructed to explore the possibilities of convening a national congress in the United States representing not only obstetricians and gynaecologists but general practitioners, nurses, and others interested in the social sciences and services to consider those problems which are related to the welfare of women.

Holland has arranged for the first International Congress in Obstetrics and Gynaecology to be held since 1912 to take place in Amsterdam next year. Obstetrics and gynaecology are vitally concerned with "race" in its widest aspects and race is now more than ever an important factor in international relations. It is therefore probable that the American National Congress mooted for 1939 will so far from detracting from the success of that to be held at Amsterdam actually serve to stimulate the nations to resort more frequently to international conferences devoted to the study of woman.

THE IDE TEST

There are many complement fixation and flocculation tests employed in the diagnosis and management of syphilis, but they are not yet perfect, and therefore any new procedure which combines simplicity and ease of performance with a high degree of specificity and of sensitivity deserves attention and trial. Such a one is the Ide test.¹ It is claimed that this test can be carried out in a few minutes with one drop of blood and in a consulting room, and the results compare favourably with such reactions as the Wassermann, Meinicke, Kahn, and others, moreover, it is equally applicable to blood serum, cerebro spinal fluid or serum exudate obtained from a blister. One drop of blood, or serum or cerebro-spinal fluid etc. is mixed with saline on a hollow glass slide and the appropriate antigen is added. The slide is then shaken for four to five minutes and the result read under the low power objective of a microscope or with a powerful lens. Positive reactions show purplish blue coloured clumps, while in a negative reaction there is no sign of clumping. The preparation of the antigen is somewhat laborious but once it is made and standardized there is no further difficulty. Briefly ox heart is extracted with alcohol, and then to the extract are added measured amounts of cholesterol, gum benzoin and dyes (crystal violet and azure II). In a comparison made by the authors with the Wassermann reaction on 1,262 sera the results were in very close agreement. The Wassermann reaction gave 119 strongly positive reactions, 10 "one plus", 7 "plus minus" and 1126 negative reactions as compared with Ide 116, 3, 3 and 1140 respectively. It is not stated what technique was employed in the Wassermann reaction with which the comparison was carried out. Inasmuch as the Wassermann tests are generally rather less sensitive than the best flocculation tests the fact that the Ide test gave rather fewer positives than the Wassermann suggests that it is not a highly sensitive test. On the other hand since apparently no false positives were recorded it would appear to be remarkably specific exactly how it compares in sensitivity with the better flocculation tests such as the Kahn, Kline or Muller-Ballungs we are not told. The Ide test is really little more than a modification of the Kline with the difference that colouring matter and gum benzoin are added to the antigen in order that the "clumping" may be seen more clearly. Even this idea is not altogether

new since Laughlen¹ has described a similar technique using scarlet-red as his dye, his test has been reported on very favourably in America. This account of the Ide test raises the question whether any "consulting room" test is or ever can be applicable to the diagnosis, control of treatment, and test of cure of syphilis. Even the simplest of tests have their pitfalls not only in the setting up of the reaction but in the reading and interpretation of results. Moreover serum tests for syphilis should be done in batches rather than singly for in this way a better control can be exercised and any faulty reagent is more likely to be recognized. It is very doubtful if the time has yet come when such investigations can be taken out of the hands of the skilled pathologist and carried out by the clinician in his consulting room. The danger of the false positive and all that it may bring in its train is too real. The pathologist has controls whereas these may not always be available to the clinician. If the Ide test were shown to be very highly sensitive a negative reaction might be useful for excluding syphilis—like the "presumptive" Kahn or "exclusion" Kline—both in cases with lesions suspicious of contagious syphilis and for testing blood donors and on other occasions when time is of importance but it will need much more testing out before it can be accepted as foolproof and suitable for the "consulting room". In the meantime no doubt the simplicity of the test will appeal to many, and certainly it seems worthy of an extended trial in this country where as yet it appears to be almost unknown.

TRANSIENT VENTRICULAR FIBRILLATION

Ventricular fibrillation has rarely been described because its presence is incompatible with a functioning left ventricle. There is reason to think that it is the cause of an unexpectedly fatal result in patients with Graves's disease, myocardial degeneration and possibly pneumonia. It is therefore of interest that clinical and graphic manifestations of the spontaneous revival of the heart from ventricular fibrillation have been recorded by Sidney P. Schwartz² in seven cases. Seven patients were suffering from transient or established auriculo-ventricular block and the attacks of ventricular fibrillation were apparently incidental. It appears that the following was what happened. The ventricular fibrillation was immediately succeeded by a brief post-fibrillary pause during which the ventricles were at a standstill. During this pause the auricles generally continued to beat but at a slowed rate. After a variable period a regular idioventricular rhythm started and increased in rate up to a maximum in some cases of about 160 a minute. Following this ventricular tachycardia which was quite distinct from the ventricular fibrillation the previously existing normal idioventricular rhythm was resumed at a rate of between 30 and 40. This sequence of events was fairly constant in all the patients who recovered from the attacks of ventricular fibrillation and lasted from a few seconds up to half an hour according to the duration of the

² *J. Amer. med. Ass.* 1936, 108, 1170.
³ *Amer. J. med. Sci.* 1936, 192, 808.

fibrillation. The clinical picture seemed definite enough to make it possible to suspect the presence of a previous attack of ventricular fibrillation. After the ventricular fibrillation had stopped and the idioventricular tachycardia had started, the skin flushed, the heart beat forcefully and regularly but the pulse at the wrist remained small. The patient recovered consciousness, screamed, spoke incoherently and was completely disorientated to his surroundings. On the resumption of the previous normal basic rate of 30 to 40 coma and unconsciousness might appear and last up to five hours. During the period of ventricular fibrillation the breathing ceased but on the resumption of the ventricular tachycardia and afterwards, it became irregular and sometimes of a Cheyne-Stokes character. Complete electrocardiographic studies are given and it appears that the observations are of definite value in the diagnosis of attacks of ventricular fibrillation in such patients. From the point of view of treatment there is little to add for the obvious drug quinine which might inhibit or cut short the period of ventricular tachycardia, is very dangerous in cases of complete heart block as it has been shown to have a paralysing effect on the idioventricular node with a fatal result.

RESEARCH IN FOOT-AND-MOUTH DISEASE

A committee including distinguished veterinary and medical members was appointed by the Ministry of Agriculture in 1924 'to direct and conduct investigations into foot and mouth disease either in this country or elsewhere with a view of discovering means whereby the invasions of the disease may be rendered less harmful to agriculture'. The fifth progress report of this committee¹ has just been issued and provides a record of continuous valuable work. Difficulties encountered in dealing with a disease of this character are great but the increasing mass of information acquired through the activities of the committee helps to keep outbreaks of the disease under control. The chief centre of research is the experimental station at Pirbright Surrey but work has also been carried out at the National Institute of Medical Research, the Lister Institute of Preventive Medicine, Manchester University, and the Oxford Bureau of Animal Population. The body of information accumulated covers the following more important factors. Washing soda or diluted caustic soda have been established as the most suitable and efficacious disinfectants. The size of the virus and its resistance to physical and chemical changes have been fully investigated. It has been shown that the particles are smaller than those of practically any other known virus, the diameter being estimated to be about one hundred thousandth part of a millimetre. Certain materials alleged to possess curative or preventive properties have been exhaustively tested so far without discovering anything of real value. The committee's researches into immunity have shown that the resistance induced by an attack of the disease is very solid and far more durable than was formerly believed. This fact encourages the hope that an effective method of

artificial immunization may not be out of reach. But this work on immunity is made difficult because several types of virus are now known to exist, each one of which can "break down" an immunity established against any of the others. The severity of attacks of all types is modified by such factors as age, sex, state of nutrition and climatic conditions. Due attention has been paid to possible means of transmission of the disease by other animals in the field and experimentally. In particular, rats, mice, rabbits, moles, voles, ferrets and various species of birds have been carefully tested. The recent discovery of the great susceptibility of the hedgehog is noted as a matter of special interest. It has provided an experimental animal which may prove of great value for the disease is conveyed by contact between one hedgehog and another in the same way as with ordinary farm stock. The committee feels hopeful that its future researches will be much facilitated by this new knowledge.

A NEW SPECIES OF RICKETTSIA

Among the numerous forms of typhus fever now recognized there is one named *fièvre boutonneuse* observed along the Mediterranean littoral which appears to be due to a species of *Rickettsia* called *R. conori*. Man is infected with this organism through the bite of a dog tick, *Rhipicephalus sanguineus*. Observations have shown that as many as 30 to 40 per cent. of dogs in the area where the disease is prevalent may carry a latent infection. Two years ago Donatien and Lestoquard² working in Algeria found that dogs exposed in the open fields became heavily infested by ticks of the species *Rhipicephalus sanguineus* developed fever and anaemia and died in one to two weeks. Examination of their blood revealed the presence of rickettsial bodies confined strictly to the interior of wandering monocytes of medium size. They occurred in the form of groups containing from four to six up to several dozen individual particles. This organism which the authors named *R. canis* is the subject of a fresh communication². Experimental inoculations have shown that *R. canis* in contradistinction to *R. conori* gives rise to a febrile reaction in the dog with the appearance of considerable numbers of histiocytes in the peripheral blood. *Rickettsia* are found in the histiocytes but never in the endothelial lining of the blood vessels or serous membranes. The monkey *Macacus mius* on the other hand reacts strongly to *R. conori* and may even die but is hardly affected at all by *R. canis*. Similarly the guinea-pig which is very sensitive to intradermal or intraperitoneal inoculation with *R. conori* shows no disturbance whatever after inoculation with *R. canis*. These differences between the two organisms are borne out by the results of cross immunity experiments. It is therefore concluded that though *R. conori* and *R. canis* both infect dogs and are both carried by the same tick they belong to different species. Preliminary observations suggest that *R. canis* is not confined to Algeria but occurs as well in the South of France.

CORONATION HONOURS

The medical names included in the Coronation Honours List of May 11 will be found set out at p 1041. Dr Christopher Addison's peerage strengthens the representation of the Labour Party in the House of Lords and rounds off a long career of service to the State. It is more than twenty-five years since Dr Addison gave up the teaching of anatomy for the hurly burly of politics. He parted company with medicine after the National Insurance Bill crisis throughout which he had been a prominent figure in and out of Parliament, but renewed his contacts again for a short time while holding office as the first Minister of Health on the amalgamation of the Local Government Board with the Insurance Commission. Sir Cuthbert Wallace's baronetcy will give great pleasure to the members of our profession; his unselfish work for St. Thomas's Medical School for the Royal College of Surgeons of England of which he is now President, and for Mount Vernon Hospital is known far and wide. The name of George Still has been a household word in paediatrics for so long that no title can add to its fame, but Dr Still's innumerable admirers and disciples will rejoice in the honour that of K C V O which comes to him this week from the King. Dr Arthur Hurst has done fine work for clinical medicine and his knighthood confers one more distinction on Guy's Hospital. Professor Edward Mellanby's K C B recognizes outstanding service to medical science and the cause of research. Obstetrics and the Birmingham Medical School are alike honoured by the knighthood for Professor Harold Beckwith Whitehouse. Air Vice Marshal Alfred William Iredell's K B E will be acclaimed by the R A F Medical Service of which he is the head and the work of Dr John Richards Harris as Minister of Public Health for the State of Victoria has earned him the same honour. Sir John Atkins receives the further distinction of K C V O and a knighthood is bestowed on Dr Arthur Edwin Horn, medical adviser to the Colonial Office. Many other well deserved awards appear in the medical list but this note must not end without congratulations to Dr J P Major on his C B E because the success of the annual meeting of the British Medical Association at Melbourne in 1935 was largely due to his enthusiasm as Honorary Local General Secretary. Three non medical honours should be mentioned here: the knighthood for Mr S P Vivian Registrar General, D B E for Mrs Pimsent late Senior Commissioner Board of Control and the O B E for Mr H N Linstead secretary of the Pharmaceutical Society.

CONTRALATERAL ARTIFICIAL PNEUMOTHORAX

Many explanations of the beneficial action of artificial pneumothorax in pulmonary tuberculosis have been given, but it is generally admitted that rest to the affected part is the most important factor. Since it is unlikely that any breathing occurs in the diseased area even before the pneumothorax is induced the rest is obtained not because the area is immobilized but because the introduction of air into the pleural cavity causes relaxation in the tensions acting on the lesion.

Some workers argue that when the mediastinum is mobile changes in the tensions in one lung are transmitted to some extent at all events to the other lung. It has also been maintained as the recent work of Lopez and A. de Carvalho with angiography confirms, that there is much slowing of the circulation in the collapsed organ while the circulation in the opposite healthy lung is definitely increased. The increase can be demonstrated even when the pneumothorax is quite small and this hyperaemia has been held to account for the not infrequent rapid healing of lesions in the contralateral lung. The above two mechanisms were no doubt in the mind of Ascoli when in 1930 he initiated the practice of contralateral pneumothorax in those patients in whom a pneumothorax on the diseased side could not be induced because the lung was adherent to the chest wall. It is essential that the mediastinum be mobile and that the pneumothorax be kept at a negative pressure so that the respiration in the "collapsed" lung is little reduced. The ideal indication for a contralateral pneumothorax appears to be a large or recurrent haemoptysis originating from an adherent lung. In a recent paper¹ Max Fournier discusses the close anatomical and mechanical interrelations between the two lungs and their vessels and then describes in detail on considerations that are largely theoretical the action of a pneumothorax on the pulmonary circulation in the collapsed and in the contralateral lung. He adds the report of a patient with bilateral disease who did not respond to rest. An artificial pneumothorax was induced on the left the worse side. This though kept at a negative pressure produced some deviation of the mediastinum to the right, where a small cavity was replaced in the skiagram by a much larger diffuse shadow which was interpreted as "congestion". Two months later the mediastinum was in the centre and the lesions on both sides were obviously healing. Four months later still residual fibrosis was all that could be seen on either side. Throughout, the pneumothorax had been kept quite small and at a negative pressure both in inspiration and in expiration after each refill.

The next session of the General Medical Council will open on Tuesday May 25 at 2 p.m., when the President Sir Norman Walker M.D. will take the chair and give an address. The Council will continue to sit from day to day until the termination of its business.

The seventeen new Fellows of the Royal Society elected on May 6 include one member of the medical profession, Dr Alan Nigel Drury, lecturer in pathology, University of Cambridge, and Dr Percival Hartley, Director of Biological Standards, National Institute for Medical Research.

We regret to announce the sudden death of Sir George Badgerow M.D. F.R.C.S. formerly dean and surgeon, Hospital for Diseases of the Throat, Nose and Ear, Golden Square, London, one of the best known Canadians in London.

ENDOCRINES IN THEORY AND PRACTICE

This article concludes the series on Endocrinology contributed by invitation

THE HISTORY OF ENDOCRINOLOGY

BY

SIR HUMPHRY ROLLESTON, Bt., G.C.V.O., K.C.B.

Nomenclature

The term "ductless glands" was used by the encyclopaedic Haller in the eighteenth century, that of "internal secretion" by Claude Bernard in 1855, endocrine and endocrinology ($\epsilon\upsilon\delta\omicron\nu\omicron\rho\omicron =$ within $\kappa\rho\iota\nu\omega =$ I separate) came into use in this century. In 1905 Starling, on the look out for a synonym for 'chemical messengers', adopted the suggestion of hormones ($\omicron\rho\omicron\upsilon\nu\omega =$ I excite) made by the late Sir W. B. Hardy and his classical colleague W. T. Vesey of Gonville and Caius College, Cambridge. Jayle (1937) argued that the word $\omicron\pi\upsilon\omega\rho\rho\alpha$ of similar derivation in the book of the *Epidemic Diseases* of Hippocrates should be translated as secretions not as 'movements' and from the context included internal as well as external secretions. The word "hormone" fitted secretin—discovered in the duodenum by Bayliss and Starling in 1902—a substance which stimulates the pancreas to secrete, but for chemical messengers which exerted the opposite a depressing or inhibitory effect the word chalones ($\chi\alpha\lambda\omicron\nu\omega =$ I relax) was suggested in 1913 by Schäfer who also proposed autacoids ($\alpha\upsilon\tau\omicron\iota\kappa\omicron =$ self, $\eta\mu\epsilon\rho\epsilon =$ drug) to include both forms. The words dysfunction, dysthyroidism and dyspituitarism have been used in two slightly different senses for an abnormal secretion of a gland—such as a thyroxine differing in its composition from that normally secreted in being incompletely oxidized as was suggested by H. S. Plummer in toxic goitre and for irregular or overlapping syndromes—such as cases of toxic goitre with some features of myxoedema or, with regard to dyspituitarism combinations of hyper and hypo pituitarism, as Cushing pointed out in 1910.

The conception and the name of anti-hormones have recently been brought forward by Loeb, Aron and Collip to explain the diminution of reaction which may follow long-continued injections of hormones. Collip and Anderson (1934) found that repeated experimental injection of the pituitary thyrotropic hormone was followed by the production of an anti-thyrotropic principle in the blood which when injected into normal animals rendered them non-reacting. This mechanism would appear to tend to preserve the endocrine balance. The synonyms given by independent workers to the same hormone, especially those of the gonads and pituitary may be puzzling and confusing; it is therefore to be hoped that a standardized nomenclature will be adhered to in the interests of clarity and precision.

Organotherapy

The use of animal and human substances with medical intent is an ancient and widespread custom among primitive races, the origin of which has been ascribed to various superstitions especially to totemism but has also come about in a somewhat capricious manner. Sometimes, however, the underlying idea appears quite obvious—namely that when a disease was thought to involve an organ—for example the heart or the lungs—that organ was employed as the remedy. Incidentally it must be admitted

that in the recent past a similar train of thought was suggested by some advertisements of glandular extracts. Evidence that organotherapy has long been practised is obvious from the contents of the early pharmacopoeias issued by the Royal College of Physicians of London, those between 1618 and 1746 containing a large number of nauseous substances which have often been compared to the contents of the witches' cauldron in *Macbeth* (1606).

Pre-scientific Suggestions

The conception of internal secretions has been read into a remark of Theophile de Bordeu in 1775 to the effect that each organ gives off 'emanations' which are necessary for the well being of other parts of the body. Like some of his contemporaries, he also laid stress on the tonic effects of the secretions of the testes and ovaries. Legallouis (1801) has been thought to have a more solid claim to be considered the forerunner of the conception of internal secretions. An important experimental proof of the internal secretion of the testes was published in 1849 by A. A. Berthold of Göttingen, who showed that transplantation of a cock's testes to another part of the body prevented the atrophy of the comb, which otherwise follows castration. This result he ascribed to the influence exerted by the testes on the blood and thus on the whole body. This observation, although the same was shown to be true for the ovaries in 1900 by Knauer and by Halben, was forgotten until Biedl exhumed it in 1910, the year that Steinach published his conclusion that sexual desire and the secondary sex characters are controlled by the internal secretions of the gonads.

Claude Bernard, Addison, and Brown-Séquard

Scientific activity in endocrinology otherwise dates from 1855 when two important events took place. On January 9, in a lecture at the Collège de France, Claude Bernard, who was much in advance of his time, pointed out that the liver had two secretions—an external one of bile into the intestine and an internal one of sugar directly into the blood. In the same year Thomas Addison of Guy's Hospital brought out his monograph *On the Constitutional and Local Effects of Disease of Supra-Renal Capsules*. In it he explained, more fully than in his address in 1849 entitled *On Anaemia Disease of the Suprarenal Capsules* that in searching for the cause of "idiopathic" (afterwards called pernicious and later Addisonian) anaemia he "stumbled" (his own word) on the association of disease of the adrenals with the definite train of symptoms to which his name was attached by Trousseau in 1856. This stimulated Brown Séquard in Paris to physiological research on the adrenals, and Sir Jonathan Hutchinson in London to collect clinical cases and post mortem specimens. Brown Séquard was a remarkable pioneer in endocrinology; probably quite unconscious of de Bordeu's speculative views, he expanded the conception of an internal secretion of the ductless glands to include all the organs and tissues of the body, thus anticipating the modern neuro-humoralism though mainly on a basis of keen imagination. Further when a septuagenarian his enthusiastic advocacy of the rejuvenating effects of testicular emulsions though naturally arousing adverse criticism, yet focused attention on the

hormonal effects of the gonads. In 1856 he found that removal of the adrenals was fatal, and ascribed this to toxæmia, poisons normally produced being no longer neutralized or removed by the adrenals. In the discussion which followed it was suggested that the results were due to the operative damage to the sympathetic. But the hypothesis that the ductless glands exerted a detoxicating effect was widely accepted, and in the case of the adrenals was not abandoned until after 1894, when Oliver and Schäfer, by experimental injection of extracts of adrenals, discovered in the adrenal medulla the pressor substance adrenaline. This the first hormone to be thus established was isolated in 1901 by Takamine and by Aldrich, and was synthesized in 1904 by Stolz. The active principle of the cortex, called cortin by Hartman (1928) and eschatin by Swingle and Pfiffner (1930), has been proved to be the hormone absence of which is responsible for the symptoms of Addison's disease, thus reversing the previous belief that these symptoms were due to absence or deficiency of adrenaline.

The Thyroid

The knowledge that the symptoms of endocrine inadequacy are due to the absence or diminution of an internal secretion present in, and necessary for, health was first established in the case of the thyroid.

Attention may be directed to two early but little known anticipations of an internal secretion of the thyroid. In 1836 Wilkinson King, lecturer on pathology at Guy's Hospital in succession to Thomas Hodgkin, described the passage of the secretion of the thyroid into its lymphatics and so into the great veins and clearly foresaw the internal secretion of the thyroid. In 1850 T. B. Curling, surgeon to the London Hospital in reporting "Two Cases of Absence of the Thyroid Body and Symmetrical Swellings of Fat Tissue at the Sides of the Neck, Connected with Defective Cerebral Development," wrote "I am not acquainted with any case on record in which a deficiency of the thyroid body has been observed in the human body," and added, "It is highly probable that this abnormal secretion of fat was dependent on the absence of those changes which result from action of the thyroid."

In 1871 when the endemic form of cretinism, recognized in the sixteenth century in the Duchy of Salzburg by Paracelsus, had practically died out in this country, Hilton Fagge described sporadic cretinism. He then prophesied that this condition might occur in adult life. Two years later his senior at Guy's Hospital Sir William Gull, described a cretinoid condition supervening in adult life in women, which in 1877 W. M. Ord named myxoedema. This was followed by active research into the physiology of the thyroid, the effects of thyroidectomy performed in 1858 were republished by Moritz Schiff in 1884, and repeated by Sir Victor Horsley in 1885 and by others. Clinical observations were widely reported, and in 1883 Sir Felix Semon put forward the view, at first denied but subsequently confirmed, that cretinism, myxoedema, and post-operative myxoedema (cachexia strumipriva) were all due to insufficiency of the thyroid gland.

Other diseases due to diminished endocrine activity or its suppression are parathyroid tetany, eunuchoidism, and disorders due to hypopituitarism—for example adiposogenital dystrophy described by Babinski in 1900 and more fully by Frohlich in the following year and Simmonds's pituitary cachexia (1914) of which progeria (*προγενος* = prematurely old) described by Sir Jonathan Hutchinson (1886) and given that name by Hastings Gilford in 1904 appears to be the juvenile form.

An interesting historical point in therapeutics is the alternating association and neglect of iodine in connexion with (a) the occurrence of goitre in districts poor in iodine, (b) the prophylactic treatment of simple goitre, and (c) the treatment of toxic goitre. Seaweed and sponge had been empirically used in the treatment of simple goitre centuries before iodine was isolated in 1814. In the first quarter of the last century it was employed with such enthusiasm that the resulting iodism led to its almost complete abandonment. In the middle of the last century Chatin's inquiries suggested that iodine was responsible for goitre, but the prophylactic use of iodine was not widely established until after the success obtained in 1916 by Marine and Kimball in North America. Toxic goitre was treated in the middle of the last century by iodine, for example, by W. B. Cheadle in 1869, but this method went completely out of fashion until about 1921.

Diseases Due to Excess of Endocrine Secretion

After it was established that absence or deficiency of the internal secretion of the thyroid caused symptoms which could be relieved by substitution treatment—namely, by the injection of an emulsion of the gland as was done by G. R. Murray in 1891 or later by an extract by the mouth (Hector Mackenzie, E. L. Fox 1892)—a further question excited interest. This was whether an excess of the normal secretion or an altered secretion produced morbid symptoms the reverse of those due to absence or deficiency of the secretion. This possibility had in fact been suggested earlier, before the introduction of the successful treatment of myxoedema by thyroid extract. Rehn in 1884 regarded toxic goitre as due to excessive thyroid secretion, and Möbius two years later argued that the disease was caused by an abnormal activity of the thyroid which poisoned the body. Much later, in 1923, H. S. Plummer and Boothby stated that exophthalmic (or toxic) goitre was due to two factors—namely, an excess of normal thyroxine and an abnormal thyroxine—whereas toxic adenoma was caused by an excess of normal thyroxine alone. Harington (1933) strongly criticized the idea of an abnormal internal secretion in toxic goitre and the general principle that pathological states of endocrine glands may produce too much or too little of their internal secretion but do not manufacture abnormal compounds has recently been emphasized by Cameron (1936). Hyperplasia, adenomas, and, less often, carcinomas of the endocrine glands may, for this is not constantly the case secrete the hormones proper to the glands but their altered histological structure logically suggests that their secretion would also be abnormal.

Diseases other than toxic goitre ascribed to excessive endocrine secretions are (i) acromegaly, at first confused clinically with myxoedema due to adenomatous growth and overactivity of the eosinophil cells in the anterior pituitary, the anterior lobe being incriminated by Tamburini in 1894 and the responsibility of the eosinophilic adenomas established in 1901 by Benda. (ii) Small adenomas composed of basophil cells in the anterior lobe (pituitary basophilism) were described as responsible for a remarkable train of symptoms by Harvey Cushing in 1932—deservedly called Cushing's syndrome, much discussion has been excited about its relation to, or identity with the adrenogenital syndrome. (iii) Although Addison's disease in 1855 was the first endocrine disease to be described it was half a century later that Bulloch and Sequiera (1905) correlated the adrenogenital syndrome of virilism with tumours of the adrenal cortex. The association of tumours of the chromaffin cells (chromaffinomas or pheochromocytomas) of the adrenal medulla with

ONE HUNDRED AND FIFTH ANNUAL MEETING, BELFAST, JULY, 1937

Treasurer N BISHOP HARMAN, LL D, FRCS

The following programme has been arranged
Wednesday July 21 (Combined meeting with Section of
Pathology Bacteriology and Immunology) 10 a.m. Dis-

discussion The Haemorrhagic States To be opened by Prof L J WITTS (London) followed by Dr N B CAPON (Liverpool) Haemorrhagic Conditions in the Newborn Dr JANET M VAUGHAN (London) and Dr S C DYKE (Wolverhampton) Clinical Pathology Dr R G MACFARLANE (London) Mechanism of Haemorrhage and Haemostasis and Dr W A. TIMPERLEY (Sheffield) Treatment of Haemophilia

Thursday July 22—10 a.m. *Discussion* Cholecystitis To be opened by Prof J W McNEE (Glasgow) followed by Dr A F HURST (Windsor) Diagnosis and Treatment Sir DAVID WILKIE (Edinburgh) The Role of Surgery Dr T GARRATT HARDMAN (Dublin) Radiology of the Gall bladder and Dr CHARLES H MILLER (London) Cardiac Pain in Gall-bladder Subjects

Friday July 23 (Combined meeting with Section of Surgery)—10 a.m. *Discussion* The Diagnosis and Treatment of Abscess of the Lung. To be opened by Dr L. S. T. BURRELL (London) and Mr J. E. H. ROBERTS (London) followed by Dr PETER KERLEY (London) Dr CARL SEMB (Oslo) Dr GEOFFREY MARSHALL (London) Dr W. BURTON WOOD (London) and Mr G. R. B. PURCE (Belfast) (Members of the Section of Radiology will be welcome at this discussion)

SURGERY

President Professor P. T. CRYMBLE, M.B., F.R.C.S. (Belfast)

Vice Presidents Professor L. R. BRAITHWAITE, M.B., F.R.C.S. (Leeds) ADAMS A. McCONNELL, M.B. F.R.C.S.I. (Dublin) HOWARD STEVENSON, M.B. F.R.C.S.I. (Belfast), REGINALD M. VICK, O.B.E., M.Chir., F.R.C.S. (London)

Honorary Secretaries H. P. MALCOLM, M.C. M.B., M.Ch. 27, College Gardens Belfast HAROLD C. EDWARDS, M.B., M.S., F.R.C.S. 57, Queen Anne Street W.1

The following programme has been arranged

Wednesday July 21—10 a.m. *Discussion* The Surgical Treatment of Non-stenosing Peptic Ulcer To be opened by Prof JOHN MORLEY (Manchester) followed by Mr N. C. LAKE (London) Mr W. H. OGILVIE (London) and Dr CARL SEMB (Oslo) *Paper* Mr H. W. RODGERS (London) The Use of the Gastroscope in Cases of Dyspepsia with Normal X-Ray Findings.

Thursday July 22—10 a.m., *Papers* Prof L. R. BRAITHWAITE (Leeds) The Significance of Bile in the Stomach Prof A. K. HENRY (London) Factors in the Successful Treatment of Severe Burns Mr J. G. YATES BELL (London) The Steinach Operation for the Relief of Prostatic Symptoms and Prof E. W. ARCHIBALD (Montreal) Cutting the Sphincter of Oddi for Relief of Pain following Cholecystectomy and Recurring Pancreatitis without Stone and for Subacute Cholangitis. *Discussion* Obstructions of the Common Bile Duct. To be opened by Mr E. R. FLINT (Leeds) followed by Mr HOWARD STEVENSON (Belfast) and Mr G. GORDON TAYLOR (London)

Friday July 23 (Combined meeting with Section of Medicine)—10 a.m., *Discussion* The Diagnosis and Treatment of Abscess of the Lung To be opened by Dr L. S. T. BURRELL (London) and Mr J. E. H. ROBERTS (London) followed by Dr PETER KERLEY (London) Dr CARL SEMB (Oslo) Dr GEOFFREY MARSHALL (London) Dr W. BURTON WOOD (London) and Mr G. R. B. PURCE (Belfast) (Members of the Section of Radiology will be welcome at this discussion.)

OBSTETRICS AND GYNAECOLOGY

President Professor C. G. LOWRY, M.D., F.R.C.S.I., F.C.O.G. (Belfast)

Vice-Presidents ALEX. J. DEMPSEY, M.B. F.C.O.G., (Belfast) T. S. S. HOLMES, M.Ch. F.R.C.S., F.C.O.G. (Belfast) Professor A. L. FYLAND, ROBINSON, M.D., F.R.C.S., F.C.O.G. (Liverpool) WILFRED SHAW, M.D., F.R.C.S., F.C.O.G. (London)

Honorary Secretaries C. H. G. MACAFEE, M.B., F.R.C.S. F.C.O.G., 18 University Square, Belfast, Mrs. HILDA N. LLOYD, M.B. F.R.C.S., F.C.O.G., 40, Harborne Road Edgbaston Birmingham

The following programme has been arranged

Wednesday July 21—10 a.m. *Discussions* (1) Obstetrical Significance of Pelvic Variations. To be opened by Prof. HERRERT THOMAS (Newhaven U.S.A.) (2) The Clinical Value of Protosil and Similar Compounds in the Treatment of Puerperal Infections. To be opened by Mr G. F. GIBBERD

(London) *Papers* Mr PERCY MALPAS (Liverpool) The Problem of Habitual Abortion and Mr V. B. GREEN ARMYTAGE (London) Hystero-salpingography—its Obstetrical and Gynaecological Importance.

Thursday July 22 (Combined meeting with Section of Nutrition)—10 a.m., *Discussion* The Nutritional Needs in Pregnancy To be opened by Sir ROBERT MCCARRISON (Oxford) Scientific and Physiological Aspect Dame LOUISE MCILROY (London) Clinical Aspect and Dr G. C. M. M. GONIGLE (Stockton-on-Tees) Public Health Aspect followed by Dr LUCY WILLS (London) Calcium Phosphorus and Osteomalacia, and Dr MARGARET J. BALFOUR (London) Practical Methods for Securing Better Nutrition in Pregnancy *Papers* Mr D. W. CURRIE (Leeds) The Use of Vitamin E in Habitual Abortion Dr R. A. McCANCE (London) The Actual Food Intakes of Pregnant Women at Different Economic Levels (Members of the Section of Hygiene and Public Health will be welcome at this meeting.)

Friday July 23—Demonstration of talking motion picture on the Forceps Operation including Episiotomy and its Anatomy kindly lent by Prof Joseph De Lee of Chicago *Papers* Mr C. H. G. MACAFEE and Mr H. I. McCLURE (Belfast) A Critical Survey of 349 Cases of Breech Delivery Prof A. H. DAVIDSON (Dublin) Vaginal Hysterectomy (cinema film) Dr KATHLEEN O. VAUGHAN (London) Posture in Child birth.

PATHOLOGY, BACTERIOLOGY, AND IMMUNOLOGY

President Sir THOMAS HOUSTON O.B.E. M.D. (Belfast)

Vice Presidents Professor S. PHILLIPS BEDSON, M.D. F.R.S. (London) S. C. DYKE, D.M. F.R.C.P. (Tottenham Staffs), N. C. GRAHAM, M.C. M.B. B.Ch. (Muckamore, Co. Antrim) Professor J. S. YOUNG, M.C., M.D. (Belfast)

Honorary Secretaries Miss EILEEN M. HICKLEY, M.D. M.R.C.P.I., 31, College Gardens Belfast Miss JANET M. VAUGHAN, D.M., M.R.C.P., British Post-Graduate Medical School, Hammersmith Hospital Ducane Road W.12

The following programme has been arranged

Wednesday July 21 (Combined meeting with Section of Medicine)—10 a.m., *Discussion* The Haemorrhagic States To be opened by Prof L. J. WITTS (London) followed by Dr N. B. CAPON (Liverpool) Haemorrhagic Conditions in the Newborn Dr JANET M. VAUGHAN (London) Idiopathic Purpura Dr S. C. DYKE (Wolverhampton) Clinical Pathology, Dr R. G. MACFARLANE (London) Mechanism of Haemorrhage and Haemostasis and Dr W. A. TIMPERLEY (Sheffield) Treatment of Haemophilia

Thursday July 22 (Combined meeting with Section of Radiology)—10 a.m., *Discussion* Bone Tumours To be opened by Dr R. E. ROBERTS (Liverpool) Prof J. S. YOUNG (Belfast) and Mr HARRY PLATT (Manchester) followed by Dr J. DUNCAN WHITE (London) and Dr J. F. BRAILS FORD (Birmingham) Members of the Section of Orthopaedics will be welcome at this discussion.)

Friday July 23—10 a.m. *Discussions* (1) Influenza To be opened by Dr C. H. ANDREWS (London) followed by Dr C. H. STUART-HARRIS (London) Dr R. W. FAIRBROTHER (Manchester) and Dr J. G. SCADDINO (London) (2) Staphylococcal Infections in Man To be opened by Prof J. W. BIGGER (Dublin) followed by Dr H. J. PARISH (Beckenham) and Dr EILEEN O. BARTLEY (Belfast)

PHARMACOLOGY AND THERAPEUTICS, INCLUDING ANAESTHETICS

(One Day to be devoted to Anaesthetics)

President Professor E. B. C. MAYRS, M.D., D.P.H. (Dunmurry Co. Antrim)

Vice-Presidents OLIVE M. ANDERSON, M.D. D.A. (Belfast), Professor DAVID CAMPBELL, M.C. M.D. F.R.F.P.S. (Aberdeen) Professor J. H. GADDUM, M.R.C.S. L.R.C.P. (London), W. B. PRINROSE, M.B., Ch.B. (Glasgow)

Honorary Secretaries J. T. LEWIS, M.D. F.R.C.P., 25 College Gardens Belfast Miss KATHARINE G. LLOYD-WILLIAMS, M.D. 48 Gordon Square, W.C.1

The following programme has been arranged

Wednesday July 21—10 a.m. *Discussion* Individual Variations in Response to Drugs To be opened by Prof.

A J CLARK (Edinburgh) followed by Prof J H GADDUM (London) Colonel L W HARRISON (London) Dr G GRAHAM (London) and Dr P MACCARVILL (Dublin) 12 noon *Paper* Dr J F BROCK (Cambridge) Iron Therapy in Hypochromic Anaemia

Thursday July 22—10 a.m. Discussion The Treatment of Circulatory Failure To be opened by Dr J CRIGHTON BRAMWELL (Manchester) followed by Prof K D WILKINSON (Birmingham) Dr S B BOYD CAMPBELL (Belfast) Dr A R. GILCHRIST (Edinburgh) and Dr E. P. POULTON (London) 12 noon *Paper* Dr NATHAN MUTCH (London) Therapeutic Use of Magnesium Trisilicate 2.30 p.m. Demonstration on the Use of Vinyl Ether by Dr VICTOR GOLDMAN (London) at Belfast Hospital for Sick Children Falls Road

Friday July 23—Session to be devoted to Anaesthetics 10 a.m. *Discussions* (1) Anaesthesia in Minor Surgery To be opened by Dr J H T CHALLIS (Woodford Green) followed by Dr RONALD JARMAN (London) Cinema Film Dr J H GILLIES (Edinburgh) Dr W B PRIMROSE (Glasgow) and Mr J S LOUGHRIDG (Belfast) (2) The Use of Vinyl Ether in General Anaesthesia (with cinema film) To be opened by Dr VICTOR GOLDMAN (London) followed by Dr MARY H MAYEUR (London), The Use of Vinyl Ether in Obstetrics

Two films will be shown one dealing with dental work in children and the other with the administration of vinyl ether for dental work

The following Sections will meet on Two Days

ANATOMY, PHYSIOLOGY, AND BIOCHEMISTRY

President Professor E. C. DODDS, M.V.O. MD, FRCP (London)

Vice Presidents Professor HENRY BARCROFT M.D. (Belfast) Professor R J BROCKLEHURST D.M. (Bristol) Professor MARY F. LUCAS KEENE, M.B. B.S. (London) Professor B. A. McSWINEY M.B., B.Ch. (London)

Honorary Secretaries RICHARD H. HUNTER, M.D., M.Ch., Anatomy Department Queen's University Belfast Professor A. WORMALL, D.Sc., Department of Biochemistry, St Bartholomew's Hospital Medical College E.C.1

The following programme has been arranged

Wednesday July 21—10 a.m., Discussion The Anatomy, Physiology and Biochemistry of the Sex Glands. To be opened by Prof E. C. DODDS (London) followed by Dr A. S. PARKES (London) Prof A. B. APPLETON (London) Dr P. M. F. BISHOP (London) Dr J. M. ROBSON (Edinburgh) and Mr W. R. WINTLTON (London) *Papers* Prof W. J. E. JESSOP (Dublin) Clinical Bearings of the Parathyroids Prof A. WORMALL (London) Recent Work in the Chemistry of Insulin and Dr R. D. LAWRENCE (London) The Use of Protamine Insulin and Similar Preparations 2.30 p.m. Demonstration at Pathological Institute of Cinema Film by Sir JOSEPH BARCROFT and Dr D. H. BARROW (Cambridge) The Effect of Experimental Lesions in the Central Nervous System on the Growth and Movements of the Foetus (Members of the Section of Neurology and Psychological Medicine will be welcome)

Friday July 23—10 a.m., Discussion Visceral Pain To be opened by Prof J. R. LEARMONTH (Aberdeen) followed by Prof J. R. LEARMONTH (Aberdeen) Prof B. A. McSWINEY (London) Prof D. T. BARRY (Cork) and Dr E. P. POULTON (London) *Papers* Dr J. DIXON BOYD (Cambridge) The Afferent Nerve Supply of Arteries with Special Reference to Pressure Receptors Dr D. H. SMYTH (Göttingen and Belfast) Vascular Reactions of the Kidney in Response to Carotid Sinus and Other Reflexes Prof T. H. MILROY (Edinburgh) Chemical Mediators in Nervous Activity and Dr S. NEVILL (London) The Application of Advances in Physiology and Biochemistry to the Study of Diseases of Muscle

DISEASES OF CHILDREN

President H. MOFFLEY FLETCHER, M.D., FRCP (London)

Vice Presidents Professor SEYMOUR G. BARLING M.B., B.S., M.Ch., F.R.C.S. (Birmingham) ROBERT MARSHALL, M.D., FRCP (Belfast) M. BRICE SMYTH, M.B., B.Ch. (Belfast)

Honorary Secretaries T. H. COZIER, M.D., MRCP, Liverpool Square Belfast URSULA SHELLEY, M.D., MRCP, 70 Wimpole Street, W.1

The following programme has been arranged

Thursday July 22—10 a.m., Discussion Dilatation and Elongation of the Colon To be opened by Prof J. R. LEARMONTH (Aberdeen) followed by Mr F. A. R. STAMMERS (Birmingham) *Papers* Dr W. R. F. COLLIS (Dublin) Modern Control of Scarlet Fever Mr W. E. M. WARDILL (Newcastle-on-Tyne) Cleft Palate

Friday July 23—10 a.m. Discussion Enuresis To be opened by Dr ROBERT HUTCHISON (London) followed by Dr STANLEY GRAHAM (Glasgow) *Paper* Prof SEYMOUR G. BARLING (Birmingham) Treatment of Tuberculous Cervical Adenitis

NEUROLOGY AND PSYCHOLOGICAL MEDICINE

President GEORGE RIDDOCH, M.D. FRCP (London)

Vice Presidents R. D. GILLESPIE, M.D. DPM. FRCP (London) J. PURDON MARTIN, M.D. FRCP (London) M. J. NOLAN, L.R.C.P. and S.I. (Belfast) Professor LAMBERT C. ROGERS, FRCS, F.R.A.C.S. (Cardiff)

Honorary Secretaries R. S. ALLISON, M.D., MRCP, 27 University Square Belfast DENIS H. BRINTON, B.M., MRCP, 27, Harley Street, W.1

The following programme has been arranged

Wednesday July 21—10 a.m. Discussion Early Diagnosis of Intracranial Tumours To be opened by (a) Dr F. M. R. WALSHIE (London) Clinical Diagnosis followed by Dr T. TENNENT (London) and Dr H. L. PARKER (Dublin) (b) Mr N. M. DOTT (Edinburgh) Special Methods of Diagnosis followed by Prof A. A. McCONNELL (Dublin) Mr G. JEFFERSON (Manchester) and Dr W. GREY WALTER (London)

Thursday July 22—10 a.m. Discussion The Mental Manifestations of Head Injury To be opened by (a) Prof E. MAPOTHER (London), Psychiatric Aspect, followed by Dr F. E. PILLINGTON (London) and Mr C. E. WINTERSTEIN (London) (b) Dr J. PURDON MARTIN (London) Neurological Aspect followed by Dr H. HILTON STEWART (Belfast) and Dr W. RITCHIE RUSSELL (Edinburgh)

NUTRITION

President Sir ROBERT McCARRISON, C.I.E., LL.D., M.D., FRCP (Oxford)

Vice Presidents Professor STUART J. COWELL, M.B., FRCP (London), J. A. SMYTH, M.D. (Belfast) LUCY WILLS, M.B. (London)

Honorary Secretaries Professor DOUGLAS C. HARRISON, D.Sc. Ph.D. Department of Biochemistry Queen's University, Belfast J. F. BROCK, D.M. MRCP., Department of Medicine, The University, Cambridge

The following programme has been arranged

Thursday July 22 (Combined meeting with Section of Obstetrics and Gynaecology)—10 a.m. Discussion The Nutritional Needs in Pregnancy To be opened by Sir ROBERT McCARRISON (Oxford) Scientific and Physiological Aspect Dame LOUISE McILROY (London) Clinical Aspect and Dr G. C. M. MCGONIGLE (Stockton-on-Tees) Public Health Aspect followed by Dr LUCY WILLS (London) Calcium Phosphorus and Osteomalacia and Dr MARGARET I. BALFOUR (London) Practical Methods for Securing Better Nutrition in Pregnancy *Papers* Mr D. W. CURRIE (Leeds) The Use of Vitamin E in Habitual Abortion Dr R. A. McCANCE (London) The Actual Food Intakes of Pregnant Women at Different Economic Levels (Members of the Section of Hygiene and Public Health will be welcome at this meeting.)

Friday July 23—10 a.m. Discussion The Physiological Basis and the Standards of Nutrition To be opened by Prof STUART J. COWELL (London) followed by Dr G. C. M. MCGONIGLE (Stockton-on-Tees) Protein Requirements, Dr HELEN M. MACKAN (London) Iron Deficiency and Anaemia Dr J. F. BROCK (Cambridge) Conditional Vitamin Deficiencies and Dr J. C. SPENCE (Newcastle-on-Tyne) Conditional Nutritional Defects *Papers* Prof W. R. FEARON (Dublin) Micrometabolic Constituents of the Modern Diet, their Sources, Distribution and Significance Dr W. R. AYERST (Coonoon) Standards of Nutrition and the Detection of Malnutrition Dr R. A. McCANCE (London) Food Intakes and Food Requirements

OPHTHALMOLOGY

President J A CRAIG M.B. F.R.C.S. (Belfast)

Vice Presidents J D M CARDELL, M.B. F.R.C.S. (London)
I A DAVIDSON, M.D. (Belfast), PERCIVAL J HAY, M.D.
(Sheffield)

Honorary Secretaries J R WHEELER, M.B. F.R.C.S.,
D.O.M.S., 6 College Gardens Belfast, EUGENE WOLFF, M.B.
F.R.C.S., 99, Harley Street, W1

The following programme has been arranged

Thursday July 22—10 a.m. *Discussion* Squint and Heterophoria with Special Reference to Orthoptic Treatment. To be opened by Mr W. H. McMULLEN (London) followed by Mr G. G. PENMAN (London) and Miss M. A. PUGH (London). *Papers* (1) Wing Commander P. C. LIVINGSTON R.A.F. (London) The Role of Heterophoria in Binocular Disharmony with Special Reference to Air Pilots (2) Miss EUPHAN M. MAXWELL (Dublin) A Note on a Case of Ectopia Lentis Associated with Arachnodactyly

Friday July 23—10 a.m., *Discussion* Affections of the Eye with Relation to Skin Diseases To be opened by Mr J. H. DOGGART (London) Ophthalmic Aspect and Dr G. B. DOWLING (London) Dermatological Aspect. *Papers* Mr R. AFFLECK GREEVES (London) Some Unusual Cases of Glaucoma Secondary to Injury Mr J. V. McAREVEY (Dublin) Corneal Transplantation in an Aphakic Eye (Members of the Section of Dermatology will be welcome at this meeting)

ORTHOPAEDICS, INCLUDING TREATMENT
OF FRACTURES

President S T IRWIN M.B. M.Ch. F.R.C.S. (Belfast)

Vice-Presidents H F MACAULEY, M.B., M.Ch. F.R.C.S.I. (Dublin) R J McCONNELL, M.B. M.Ch. (Belfast), T P McMURRAY M.B., M.Ch. F.R.C.S.Ed. (Liverpool)

Honorary Secretaries CECIL A CALVERT M.B. F.R.C.S.I. 8 University Square Belfast, Miss E. HENRIETTA JEBENS, M.B. F.R.C.S. 56 Wimpole Street W1

The following programme has been arranged

Wednesday July 21—10 a.m. *Discussion* Operative Treatment and Results in Fracture of the Neck of the Femur To be opened by Prof E. W. HEY GROVES (Bristol) and Dr SVEN JOHANSSON (Göteborg) followed by Dr ELLIS JONES (Los Angeles) Mr ERIC J LLOYD (London) Mr R. WATSON JONES (Liverpool) Mr H. A. BRITAIN (Norwich) and Mr H. O. CLARKE (Manchester) 2 p.m., Exhibition of Cinema Films demonstrating the Treatment of the Neck of the Femur by speakers in the discussion in the Sectional Room at the University

Friday July 23—10 a.m. *Discussions* (1) Modern Treatment of Club-foot To be opened by Mr DENIS BROWNE (London) and Mr E. P. BROCKMAN (London) followed by Mr T. P. McMURRAY (Liverpool) and Miss M. FORRESTER BROWN (Bath) (2) Treatment of Tennis Elbow To be opened by Mr G. P. MILLS (Birmingham)

OTO-RHINO-LARYNGOLOGY

President HENRY HANNA M.B. B.Ch. (Belfast)

Vice-Presidents J W KILLEN M.B. F.R.C.S.I. (London) derry) D F A NEILSON F.R.C.S. (London) DONALD WHEELER, M.B. F.R.C.S. (London) F G WRIGLEY M.D. (Manchester)

Honorary Secretaries F A. McLAUGHLIN M.B., F.R.C.S. 71, University Road Belfast F. C. W. CAPPS F.R.C.S., 16 Park Square East, NW1

The following programme has been arranged

Wednesday July 21—*Papers* Mr A. A. McCONNELL (Dublin) Non suppurative Complications of Otitis Media Mr V. F. LAMBERT (Manchester) The Vocal Cords of Singers Mr L. GRAHAM BROWN (London) External Otitis Mr R. R. WOODS (Dublin) The Audiometer and Differential Diagnosis in Deafness

Friday July 23 (Combined meeting with Section of Hygiene and Public Health)—10 a.m., *Discussion* Prevention and Treatment of Diphtheria To be opened by Dr A. GARDNER ROBB (Belfast) followed by Dr E. H. R. HARRIES (London) and Dr C. J. McSWEENEY (Dublin). *Papers* Dr E. H. T. NASH (Hounslow) and Dr G. CHESNEY (Poole) Diphtheria Immunization

HYGIENE AND PUBLIC HEALTH

President Professor W J WILSON M.D. D.P.H. (Belfast)

Vice-Presidents Professor J JOHNSTONE JERVIS M.D., D.P.H. (Leeds) ELWIN H. T. NASH, M.R.C.S., M.R.C.P., D.P.H. (Hounslow) A. GARDNER ROBB M.B., D.P.H. (Belfast), C. S. THOMSON M.D., M.R.C.P.Ed., D.P.H. (Belfast)

Honorary Secretaries F F KANE, M.D. M.R.C.P.I., D.P.H., Purdysburn Fever Hospital Belfast H. E. COLLIER M.C., M.B., Ch.B., University of Birmingham, Edmund Street, Birmingham.

The following programme has been arranged

Wednesday July 21—10 a.m. *Discussion* Enteric Fever To be opened by Dr J. RITCHIE (Dumfries) followed by Mr A. FELIX (London) Dr S. WATSON SMITH (Bournemouth) Dr S. H. COOKSON (Bournemouth) Lieut.-Col. C. H. H. HAROLD (London), Major General H. M. J. PERRY (London) Dr E. H. R. HARRIES (London) Dr C. J. McSWEENEY (Dublin) Dr C. S. THOMSON (Belfast) Dr A. GARDNER ROBB (Belfast) and Dr R. J. MAULE HORNE (Poole). *Paper* Dr F. MAY ERSKINE (Belfast) Goitre in School Children

Friday July 23 (Combined meeting with Section of Otorhinolaryngology)—10 a.m., *Discussion* Prevention and Treatment of Diphtheria. To be opened by Dr A. GARDNER ROBB (Belfast) followed by Dr E. H. R. HARRIES (London) and Dr C. J. McSWEENEY (Dublin). *Papers* Dr E. H. T. NASH (Hounslow) and Dr G. CHESNEY (Poole) Diphtheria Immunization

RADIOLOGY

President J C. RANKIN, M.D. (Belfast)

Vice Presidents R. MAITLAND BEATH M.B. B.S. (Belfast) STANFORD CADE F.R.C.S. (London) E. W. TWINING M.R.C.S., L.R.C.P. D.M.R.E. (Manchester)

Honorary Secretaries F. P. MONTGOMERY M.C. M.B., D.M.R.E. Elmwood University Terrace Belfast GRACE BATTEN, B.M. D.M.R.E. Mount Vernon Hospital Northwood, Middlesex.

The following programme has been arranged

Wednesday July 21—10 a.m. *Papers* Dr E. W. TWINING (Manchester), Tomography, Dr A. B. MACLEAN (Glasgow) Normogram for Radiography Dr C. L. McDONOGH (Dublin) Radiological Diagnosis in Obstetrics and Gynaecology, Dr STANFORD CADE (London) Distance Mass Radiation (the Bomb) with film.

Thursday July 22 (Combined meeting with Section of Pathology Bacteriology and Immunology)—10 a.m., *Discussion* Bone Tumours To be opened by Dr R. E. ROBERTS (Liverpool) Prof J. S. YOUNG (Belfast) and Mr HARRY PLATT (Manchester) followed by Dr J. DUNCAN WHITE (London) and Dr J. F. BRAILSFORD (Birmingham) (Members of the Section of Orthopaedics will be welcome at this discussion.)

TUBERCULOSIS

President JOHN R. GILLESPIE, M.D. D.P.H. (Belfast)

Vice Presidents GEOFFREY MARSHALL, OBE, M.D., F.R.C.P. (London) J. E. H. ROBERTS OBE M.B., F.R.C.S. (London) A. TRIMBLE, M.B., B.Ch. D.P.H. (Belfast)

Honorary Secretaries B. R. CLARKE, M.D. Forster Green Hospital for Consumption and Chest Diseases Fortbrea Belfast A. J. MORLAND M.D., M.R.C.P., 135 Harley Street, W1

The following programme has been arranged

Wednesday July 21—10 a.m. *Discussion* Tuberculosis in Hospital Workers To be opened by Dr PETER W. EDWARDS (Cheshire Joint Sanatorium) followed by Dr J. WATT (King George V Sanatorium Godalming) Dr ESTHER CARLING (Berks and Bucks Joint Sanatorium) Dr MADGE MACALIN (University of Western Ontario) and Dr R. MARSHALL (Belfast) 11.30 a.m., *Discussion* The Early Diagnosis of Pulmonary Tuberculosis To be opened by Dr G. MARSHALL (London) followed by Dr L. S. T. BURRELL (London) Dr M. F. O'HEA (Dublin) and Dr J. A. L. JOHNSTON (London derry) 2.30 p.m. Demonstration at Forster Green Hospital (Diseases of the Chest and Tuberculosis) Belfast

Thursday July 22—10 a.m. *Discussion* The Surgical Treatment of Apical Tuberculous Cavities To be opened by Dr CARL SEMB (Oslo) followed by Mr J. E. H. ROBERTS (London), Dr A. J. MORLAND (London) Mr G. A. MASON (Newcastle upon Tyne) Dr G. S. TODD (Midhurst Sana

torium) and Mr H MORRISTON DAVIES (Ruthin) 12 noon
Discussion Artificial Pneumothorax with Special Reference
to Bilateral Collapse To be opened by Dr J CROCKETT
(Glasgow) 2.30 p.m., Demonstration at Belfast Municipal
Sanatorium (Tuberculosis) Whiteabbey

The following Sections will meet on One Day

DERMATOLOGY

President G B DOWLING, M.D., F.R.C.P. (London)
Vice Presidents S W ALLWORTHY, M.D. (Belfast)
REGINALD T BRAIN, M.D. F.R.C.P. (London) W G HARVEY
M.D. F.R.C.P.I. (Dublin)
Honorary Secretaries IVAN H McCAW, M.D. 10 College
Gardens Belfast R MASON, B.O.M.B. Ch 11, Syden
ham Terrace Newcastle-on-Tyne

The following programme has been arranged

Thursday July 22—10 a.m., *Discussion* Autophytic
Dermatitis To be opened by Dr HENRY MACCORMAC
(London) followed by Dr R D GILLESPIE (London) *Papers*
Dr R T BRAIN (London) The Methods and Difficulty of
Investigating Virus Diseases of the Skin and Dr F A E.
SILCOCK (Leicester) Some Minor Methods in Dermatology
Afternoon demonstration of cases and pathological specimens
in the King Edward VII Hall at the Royal Victoria Hospital
(Members of the Section are invited to attend the discussion
on "Affections of the Eye with Relation to Skin Diseases"
in the Section of Ophthalmology on Friday, July 23)

MEDICAL SOCIOLOGY

President THOMAS CARNWATH, D.S.O., M.B. (London)
Vice Presidents Mr ERNEST BEVIN Chairman Trades
Union General Council (London) Sir FRANCIS E. FREMANTLE,
O.B.E. M.D., F.R.C.P. F.R.C.S. M.P. (Hatfield) LEONARD
KIDD M.D. (Enniskillen) Mrs F W OGILVIE, M.A. (Belfast),
Mr J E. WILSON (Belfast)
Honorary Secretaries JAMES BOYD M.D. F.R.C.P.I. D.P.H.,
18 Cadogan Park Belfast Miss OLGA SPICER Secretary
Institute of Labour Management, Terminal House 52
Grosvenor Gardens SW1

The following programme has been arranged

Friday July 23—10 a.m., *Discussion* The Wider Issues of
Health Legislation in Industry To be opened by Dr L P
LOCKHART (Nottingham), Dr R E. LANE (Manchester) Mr
ERNEST BEVIN (London) and Mr J E. WILSON (Belfast)

 4.0 p.m.—Garden Party at Mount Stewart Co Down by invitation of the Marquess and Marchioness of Londonderry
 4.0 p.m.—Garden Party at "Seapark" Greenisland by invitation of Sir George and Lady Clark
 4.0 p.m.—Garden Party at Mount Norris, Newcastle by invitation of Mrs R. R. Leatham.
 8.0 p.m.—Popular Lecture by Major General William P. MacArthur D.S.O. F.R.C.P. A.M.S. Insects and Disease Assembly Hall
 9.30 p.m.—Branch and Division Reception and Dance at Floral Hall Hazelwood and Zoological Gardens Bellevue.

Saturday July 24

- 9.30 a.m.—Excursion to Giant's Causeway and Antrim Coast Road
 4.0 p.m.—Garden Party

The Local Honorary General Secretary of the Meeting is Dr F. M. B. Allen, and the Assistant Local Honorary General Secretary Dr R. W. M. Strain. Communications should be addressed to the Whitla Medical Institute College Square North Belfast.

ACADEMIC ROBES

Academic robes which will be worn at the functions indicated * in the above programme may be obtained from Messrs Ede and Ravenscroft official robe makers to the Association 93-94 Chancery Lane, London, W.C.2

HOTEL ACCOMMODATION

First-class accommodation is still available at the Shree Donard Hotel Newcastle Co Down Laharna and Olderfleet Hotels Larne Co Antrim Regent Palace Hotel and Royal Hotel Bangor, Co Down the Mount

Royal Hotel and the Imperial Hotel Donaghadee, Co Down. These are suitable for members who intend bringing their cars. Application for these should be made direct to Messrs Thos Cook and Son, 27, Royal Avenue, Belfast, but applications for private hospitality, lodgings or students hostels should be addressed to the Secretary B.M.A., Whitla Medical Institute, College Square North, Belfast.

ACCOMMODATION AND CRUISE ON
S.S. "ALMANZORA"

To supplement the limited accommodation in an attractive manner arrangements have been made, with the approval of the Council of the Association, for provision of accommodation on board the s.s. *Almanzora*. During the period of the meeting the liner will be moored, in order that members may take a full part in all the social and scientific activities. Moreover, the mooring berth will be adjacent to a tram service which will take members to the city centre in ten to fifteen minutes. At the close of the meeting the liner will leave Belfast and, proceeding via the Inner and Outer Hebrides and Scapa Flow, will cruise in the Norwegian Fjords, visiting Trondhjem, Merok, Hellsøylt, Oie, and other places of interest. The liner will return to Southampton on August 3. This cruise has been planned by Pickfords Travel Service in conjunction with the Royal Mail Lines, and members of the Association who propose to attend the Belfast meeting and are interested in these arrangements are asked to make an early application to Messrs Pickfords at 205 and 206, High Holborn, W.C.1, or at any of their branches.

TRAVELLING ARRANGEMENTS AND
"CONFERENCE" TICKETS

As on this occasion the journey to the place of meeting necessitates travel outside the limit of the English railways, arrangements have been made for the issue to members and those accompanying them to Belfast of a special Conference Ticket at the rate of the ordinary first or third class single fare plus one third for the return journey. This conference rate is more favourable than the special summer or monthly ticket available to all travellers by rail, and can only be obtained on presenting a voucher at the booking office of the station of departure. The vouchers can be obtained from the Financial Secretary B.M.A. House, Tavistock Square London, W.C.1, a separate voucher being required for each individual travelling.

Intending visitors are reminded that early booking of sleeping berths and car space on the cross-channel steamers is advisable and the motor organizations will assist in this matter. Extra steamship services will be available as required subject to notice being given by intending passengers. The Larne Stranraer route is the shortest sea passage (1½ hours open sea), and will not be seriously interfered with by the Glasgow Fair holiday, as sleeping accommodation on board is not required.

AIR SERVICES

As a supplement to the train and boat services members may like to consider the facilities offered by the air routes operating from the principal towns in the British Isles to Belfast. By means of inter-availability arrangements between the railway companies and the air services passengers holding ordinary return air tickets may if they wish exchange the return half at a railway booking office for a first-class single ticket. The companies concerned have agreed that this privilege shall also apply in respect of the special "conference" tickets issued for the Belfast Meeting, the supplement payable being the difference between the value of the return half of the rail ticket and the full air fare. Hand baggage up to 35 lb per passenger is allowed free. Heavy luggage may be forwarded in advance by rail at special rates.

The following table shows the approximate flying hours

from certain points within the British Isles to Belfast and the single and return fares

From—	Approximate Transit Time Hrs. Mins.	Fares	
		Single	Return
Birmingham (Castle Bromwich)	2 10	80/-	132/-
Bristol	4 25	96/-	158/-
Cardiff	6 0	98/6	160/-
Carlisle	3 20	52/-	89/-
Cheltenham and Gloucester	5 5	90/-	150/-
London (Croydon)	3 5	110/-	180/-
Liverpool (Speke)	1 15	59/-	90/-
Manchester (Barton)	1 45	55/-	90/-

Reservations may be made at Airway Terminus Victoria Station London SW1 Euston House Seymour Street, London NW1 all Railway Air Services booking offices, all principal railway stations if due notice is given

THE ANNUAL DINNER, JULY 22

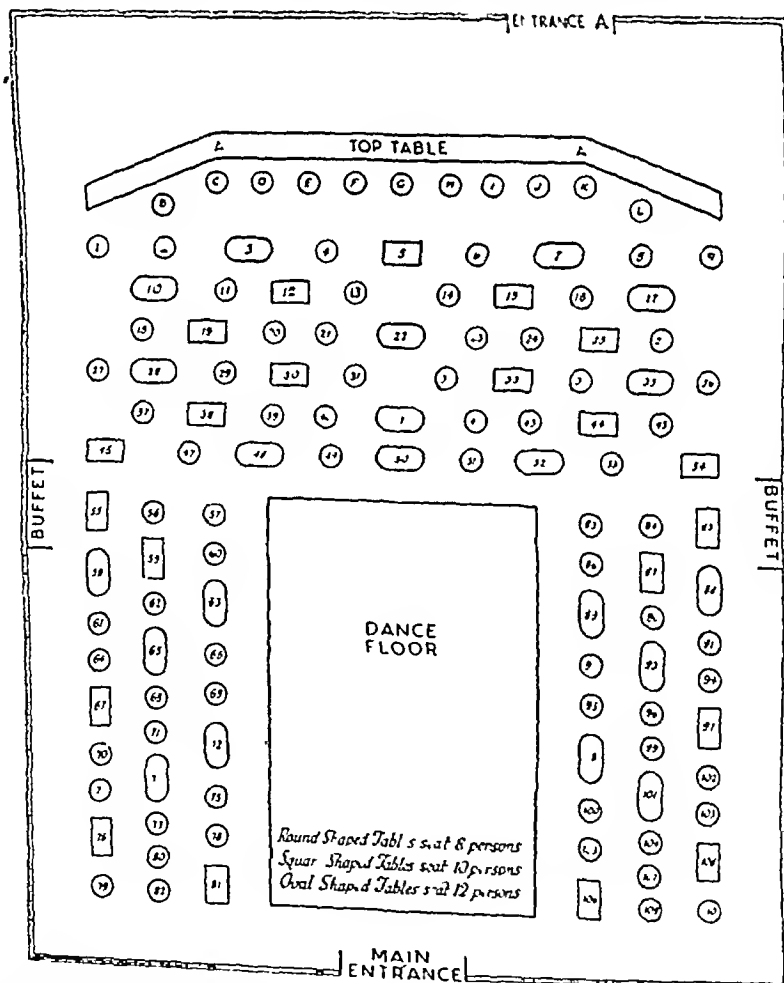

AN INNOVATION

As already announced (*Supplement* April 10 p 179) an innovation is being made in the form of the Annual

appeal to the younger members of the Association as the dances and receptions generally held on the other evenings of the Meeting and accordingly has decided to hold a dinner dance instead

The Kings Hall, Balmoral which has been booked for the occasion is capable of accommodating some 1,200 guests at tables for 8 10 or 12 persons arranged in horseshoe formation round a specially laid dance floor. The toast list and speeches will be limited and it is hoped that dancing will start about 10 o'clock. The Hall is about the size of the main hall at Olympia but the very efficient sound amplifying system will ensure that speeches will be clearly heard in all parts of the room.

It is hoped that members will make up their own parties and seats may be booked according to the position on the Table Plan which is reproduced on this page. If the exact table requested is not available the nearest table of that size will be allocated. Where a request is made for parties not large enough to fill a table seats will be allotted by the Dinner Committee. The ticket for the dinner and dance will 10s 6d, exclusive of wines and seats may be booked in advance upon receipt of payment. The numbers of the tables already booked are 1-9 14 16 21, 22, 27-32, 34, 37-45 47-53 55 56 57 59 60, 62 63, 65 66 68 69 72 74 75, 78 81 83 86, 89 90, 92 93,

B.M.A. Dinner on Thursday July 22. The Local Executive feels that a purely formal dinner such as has been held on previous occasions does not make as wide an

TAKING THE CAR TO NORTHERN IRELAND

In view of the fact that many English and Scottish motorists are unfamiliar with motoring laws and conditions in Northern Ireland, the following details are given for the benefit of those members of the British Medical Association attending the Annual Meeting in Belfast who contemplate transporting their cars to the Ulster capital.

First and foremost the important fact must be emphasized that no Customs barrier exists between Northern Ireland and Great Britain. Therefore when the car has been disembarked on Northern Ireland soil the British motorist has no concern with irritating Customs formalities. Furthermore, motoring laws and regulations operating in Northern Ireland are practically identical with those in force throughout Great Britain with the one important exception—that a general speed limit for motorists is not applicable to this province. The visitor's driving licence, his Road Fund tax, and in almost every instance, his insurance policy are all valid for a temporary stay in Northern Ireland. So it will be obvious that once transport arrangements are completed the motorist is entitled to drive where he chooses in this part of Ireland.

Transport by Sea

When considering a motoring holiday in Northern Ireland transport by sea is an important question to the motorist from Britain. There is a fairly wide choice of shipping services operating between English, Scottish and Northern Irish ports. For example daily sailings take place between Liverpool and Belfast, Heysham and Belfast, and Glasgow and Belfast. Cars may also be shipped daily between Stranraer and Larne. During the summer period—that is from May 1 until September 30—morning and evening services operate between the last named ports.

In addition to the foregoing steamship services operate between London, Plymouth, Southampton and Belfast. Full particulars of sailings, freight charges for cars and passenger fares are as follows:

LONDON-BELFAST (*Clyde Shipping Co. Sailings from London each Tuesday and Friday*)

Car Transport	OR
Per ton	£5 0 0
Minimum	£3 10 0
Passenger Fares	
Saloon single, 55s.	Return 100s
Third-class single	25s

SOUTHAMPTON-BELFAST (*Clyde Shipping Co. Sailings from Southampton each Saturday*)

Car Transport	OR
Per ton	£5 10 0
Minimum	£3 10 0
Passenger Fares	
Saloon single 50s.	Saloon return 90s
Third-class single	22s 6d

PLYMOUTH-BELFAST (*Clyde Shipping Co. Sailings from Plymouth each Friday*)

Car Transport	OR
Per ton	£5 10 0
Minimum	£3 10 0

Passenger Fares

Saloon single 45s. Saloon return (to Glasgow) 80s
(No call at Belfast on outward journey but passengers are landed at Glasgow paying their own fare thence to Belfast.)
Third-class single 22s 6d

(On each of the above trips food costs about 10s. 6d. per day. Return tickets are available for six months but are not issued for third-class passengers.)

From the point of view of some English visitors the choice of route will lie between either Heysham or Liverpool and on both of these routes the loading and unloading facilities for

cars are modern and quite satisfactory. There is little difference in the freight charges levied by the shipping companies concerned as the following figures will demonstrate.

BELFAST-LIVERPOOL (*Belfast Steamship Co. Ltd. Sailings daily except Sunday*)

Car Transport	
Weight not exceeding 10 cwt	£3 0 0
" " 15	£3 5 0
" " 20	£3 10 0
For each additional cwt over 20 cwt	£0 1 6
Tricars up to 8 cwt	£2 12 6

Passenger Fares

Saloon single 22s 6d. return 37s 6d.
Third-class single 10s 6d. return, 21s

(Return tickets are available for three months)

BELFAST-HEYSHAM (*London Midland and Scottish Railway. Sailings daily*)

Car Transport	OR	CR
Weight not exceeding 10 cwt	£2 16 3	£3 3 9
Each additional cwt or part	£0 1 6	£0 1 6

Passenger Fares

Saloon single 22s 6d., return, 37s 6d.
Third-class single 10s 6d. return 21s

(Return tickets are available for three months)

It is of importance to mention that a Sunday night sailing takes place between Heysham and Belfast and vice versa although cars are not accepted for conveyance on Sunday nights.

The Scottish visitor too is well catered for so far as shipping facilities are concerned. He may proceed to Belfast via Glasgow direct, via Ardrrossan or via Stranraer and Larne. Here again freight charges do not vary to any appreciable degree. The rates on the various services mentioned are given below.

BELFAST-GLASGOW (*Burns and Laird Lines Ltd. Sailings daily except Sunday*)

Car Transport	
Not exceeding 10 cwt	each £3 0 0
Over 10 cwt and not exceeding 15 cwt	each £3 5 0
Over 15 cwt and not exceeding 20 cwt	each £3 10 0
Each additional cwt or part	£0 1 6

Passenger Fares

First-class single £1 0 0
return £1 12 0
Third-class single £0 9 6
" , return £0 19 0

(Return tickets are available for three months)

BELFAST-ARDROSSAN (*Burns and Laird Lines Ltd. Sailings daily except Sunday*)

Car Transport	OR
Not exceeding 10 cwt	each £2 10 0
Over 10 cwt and not exceeding 15 cwt	each £2 15 0
Over 15 cwt and not exceeding 25 cwt	each £3 0 0
Each additional cwt or part	£0 1 6

Passenger Fares

Saloon single 17s 6d. return 28s
Third-class single 8s

(Return tickets are available for three months)

LARNE-STRANRAER (*London Midland and Scottish Railway. Sailings twice daily*)

Car Transport	OR
Not exceeding 10 cwt	£2 5 6
Over 10 cwt and not exceeding 25 cwt	3 0 6
Over 25 cwt for each additional cwt or part	£0 1 6

Passenger Fares

Saloon single 10s. saloon return 20s
Steerage single 6s. steerage return, 12s

On each of the services mentioned a motor car may now be shipped outward and return by the same route at a freight charge of fare and a half, provided the car is accompanied by two adult passengers for whom return tickets are taken.

The Automobile Association which has efficient Port Officers at all ports mentioned who will supervise loading and unloading operations will be pleased to relieve the member of all matters connected with the shipment of vehicles. The A.A. will reserve space for cars, book any passenger accommodation required, procure passenger tickets and in other words complete negotiations on behalf of members so that the visitor is free from any petty annoyances connected with this aspect of his holiday. An important point to be remembered is that during the summer months—and this year will certainly be no exception—steamship bookings are particularly heavy, and it is very desirable that lengthy notice should be given to either the shipping company direct or to the A.A., to ensure that the required accommodation can be secured.

Garage accommodation for cars in and around Belfast need present no difficulty to the visitor. The city is adequately supplied with garage establishments which are efficiently staffed and equipped with modern plant thus ensuring the competent handling of any class of repair work. A list of garages in and around Belfast appeared in the Supplement of May 1 p. 246.

Irish Free State—Those visitors who wish to embrace the Irish Free State in their tour should bear in mind that important Customs formalities must be complied with before a motor vehicle can be taken across the land frontier between Northern Ireland and the Irish Free State. In this direction it is suggested that those who are interested should make application to the nearest A.A. Branch Office or to the Belfast Office of the association at Farnham House 5 Oxford Street when full particulars of Customs requirements will be readily advanced.

We are informed that the R.A.C. will provide similar facilities for their members and they advise intending visitors to get into early communication with either their head office Pall Mall, London SW1 or their local branch office 65, Chester Street, Belfast, well in advance of their departure.

Motorists desiring further information should apply to either the A.A. or the R.A.C. for the appropriate guide book. The Ulster Tourist Development Association 6 Royal Avenue, Belfast, have a very useful volume on motoring, which includes a number of tours in and around Belfast and in Northern Ireland generally. Intending motorists are advised to apply for this to the above address.

British Medical Association

ANNUAL REPRESENTATIVE MEETING, BELFAST, 1937

The Annual Representative Meeting of the British Medical Association will be held in the Assembly Hall Assembly Buildings Fishwick Place Belfast, on Friday, Saturday, Monday and Tuesday, July 16, 17, 19, and 20 1937.

RESOLUTIONS BY DIVISIONS AND BRANCHES FOR THE REPRESENTATIVE BODY

INDEX TO ADVERTISEMENTS IN BRITISH MEDICAL JOURNAL

Motion by SOUTHPORT That (with reference to para 53 of Annual Report of Council) the Representative Body protests strongly against the omission of an index to advertisements in the *British Medical Journal* and instructs the Council to consider the restoration of this index at the earliest possible date, as many members are inconvenienced by its absence.

DENTAL BENEFIT REGULATIONS

Motion by SOUTHPORT and LANARKSHIRE That (with reference to para 83 of Annual Report of Council) the Representative Body disapproves of the adoption of a sliding scale for the administration of general anaesthetics for the removal of teeth, and that the policy of the Association as previously expressed be adhered to.

Motion by WAKEFIELD, PONTEFRAC, and CASTLEFORD That (with reference to para 83 of Annual Report of Council) one guinea should be the minimum fee for any general anaesthetic (excluding gas and oxygen) administered by a medical practitioner.

INVESTIGATION OF DEATHS FROM CANCER

Motion by WAKEFIELD, PONTEFRAC, and CASTLEFORD That (with reference to para 86 of Annual Report of Council) the minimum fee for a report made by a medical practitioner to a medical officer of health in connexion with the investigation of deaths from cancer be five shillings.

REMUNERATION OF MEDICAL PRACTITIONERS EMPLOYED PART TIME BY LOCAL AUTHORITIES

Motion by PORTSMOUTH That (with reference to para 103 of Annual Report of Council) the following section B (13) of the Scale of Remuneration of Medical Practitioners Employed Part time by Local Authorities, as adopted by the A.R.M. 1936 (Min 122)

'(13)—Immunization for Diphtheria

Not less than 7s 6d per immunized person, the local authority supplying the materials
be rescinded and the following adopted in substitution thereof

"(13)—Immunization for Diphtheria

Not less than 5s per immunized person the local authority supplying the materials, this fee not to refer to Schick tests.

Motion by PORTSMOUTH That (with reference to para 103 of Annual Report of Council) the Representative Body is of opinion that the local authority should utilize the services of general practitioners in the area of the said authority for carrying out the work of diphtheria immunization at the minimum fee of 5s.

FEES FOR MEDICAL EXAMINATION AND REPORT FOR LIFE ASSURANCE

Motion by LANARKSHIRE That the minimum fee for medical examination and report for life assurance be 10s 6d.

DIVISIONS AND BRANCHES AND NATIONAL HEALTH INSURANCE

Motion by CHELSEA That copies of the circular letters sent by the Insurance Acts Committee and Council of the Association to secretaries of Local Medical and Panel Committees and insurance practitioners be sent at the same time for their information, to those honorary secretaries of the Divisions and Branches who as a result of inquiry intimate a wish to have them.

SUPERANNUATION SCHEME FOR PORTER STAFF B.M.A. HOUSE

Motion by CHELSEA That it be an instruction to the Council to consider the question of establishing a superannuation scheme for the porter staff employed by the Association at B.M.A. House.

THE ASSOCIATION AND INDUSTRY

It was recently reported in these columns that a joint standing committee composed of representatives of the British Medical Association and the Trades Union Council, has been established for the purpose of discussing general medical questions of mutual interest. This desire for co-operation on the part of the representatives of a large section of the industrial population is a recognition of the endeavours of the Association to promote the welfare of the industrial worker.

Fractures

The Association's work in recent years has indeed included much that closely affects industry, both directly and indirectly. The report of the Fractures Committee for instance has a far-reaching effect on industry. It will be remembered that this report showed how enormous was the annual loss to industry due to accidents resulting in fractures and associated injuries of the limbs, and in recommending the extension of organized clinics for the treatment of fractures it showed that whereas 276 cases treated by unorganized methods involved incapacity for a total period of 13,206 weeks, this period could have been reduced to 4,440 weeks if treatment had been given in organized clinics. Incapacity remained permanent in only 1 per cent of the cases treated in organized clinics, while 37 per cent of the patients treated otherwise became permanently incapacitated. On the assumption that these 276 workers would have been in regular employment during the excess period of disability at an average wage of £2 10s per week the Committee estimates that they lost £22,000 in wages. The Committee therefore proposed a scheme for a model fracture unit which would be in charge of a special surgeon and would provide for in-patient treatment and for weekly and bi-weekly clinics for ambulatory cases. It suggested that employers of labour on a big scale might find it advisable and convenient to provide their own rehabilitation centres and pointed out that the provision of these centres, whether attached to hospitals or situated at the factory, was a matter in which employers, hospitals, doctors and insurance companies should maintain the closest co-operation.

The report of the Fractures Committee aroused much interest in both medical and non-medical circles. A number of Divisions of the B.M.A. have arranged lectures on the subject of fractures; the plans of certain new hospitals have included provision for fracture units and the General Federation of Trade Unions a body which has performed valuable work in disseminating information on medical problems among its constituents convened a conference to consider the application to industry of the recommendations of the Fractures Committee. One of the most promising signs of a new era in fracture treatment is the appointment by the Home Office and the Ministry of Health of an Interdepartmental Committee to inquire into the arrangements at present in operation with a view to the restoration of the working capacity of persons injured by accidents and to report as to what improvements and developments are desirable and what steps are expedient to give effect thereto regard being had to the recommendations made in the report issued by the British Medical Association on fractures. At an early stage of the work of this Committee a consultation was held with the Association on the medical aspects of the problem and on the best methods of conducting the investigation.

Miners' Nystagmus

The Miners' Nystagmus Committee of the B.M.A. has dealt with a problem of very serious concern to industry, for

it is estimated that 25 per cent of all workmen employed underground show physical signs of miners' nystagmus. The patients often suffer great hardship, even after they have recovered from the disease, for some colliery managers refuse to employ underground any man who has at any time suffered from nystagmus. The Committee which was appointed to consider and report upon the possibility of securing improved methods of procedure in the diagnosis and certification of miners' nystagmus recommended a system of certification and classification which would exclude from the mining industry those men who were found to be unsuited for the work, and which would facilitate the early return to work of those who could be restored to working capacity after developing the disease. It emphasized the necessity for a new attitude towards the disease among both employers and employed, and pointed out that the problem could be solved only by the continuous and close co-operation of colliery managers, the medical profession and the miners themselves. After the Committee had begun its work the Home Secretary appointed a Departmental Committee on the Workmen's Compensation Act with special reference to miners' nystagmus, and the B.M.A. Committee's report was used as the basis of the evidence submitted by the Association on the subject of nystagmus.

Rehabilitation

Both these Committees had to face the problem of the rehabilitation of the disabled workman, a problem which is of very great importance to industry in general, and, indeed to the community as a whole. It seems to the Association that the greatest fault of the present system of workmen's compensation is the concentration on the provision of financial compensation rather than on the restoration of the injured workman to his working capacity at the earliest possible date. The payment of compensation frequently tends to prolong invalidity, which in its turn may produce a psychoneurotic patient who loses his original recuperative powers and is unable to utilize what working capacity he has. The lump sum form of compensation may be especially insidious in its effect upon the recipient and the Association is of the opinion that this method of compensation should be reserved for permanently incapacitated workmen who have arrived at their minimum disability. It also suggests that advisory committees should be available to workmen receiving lump sums for the purpose of assisting them to employ the money to the best advantage.

Another difficulty in the restoration of an injured person to his full working capacity occurs during convalescence. Although the patient is unable to return to his ordinary duties he is able to perform a certain amount of light work. Large firms are sometimes able to provide light work for their disabled employees and such work is found to be of aid in the restoration of full working capacity, but very frequently the injured workman is unable to obtain suitable employment. The Association therefore believes that serious consideration should be given by all the sections of the community concerned to the preparation of a plan in which attention would be concentrated on adequate treatment and rehabilitation rather than on financial and especially lump sum compensation. It suggests that the desired object could be achieved by the establishment of a system of rehabilitation units which would reduce the cost of compensation and enable the workman in the shortest possible period either to regain his full working capacity or to utilize a reduced capacity to the best advantage. The centre would provide temporary light work for a man who was undergoing such treatment.

as would ultimately enable him to resume his original work and it would provide vocational training for those workmen whose disability made it necessary for them to seek a different occupation. Recommendations on these lines were included in the Memorandum of Evidence submitted last year to the Departmental Committee on the Workmen's Compensation Act, and the possibility of the development of the proposal is at present being investigated by the Joint Committee of the B.M.A. and the T.U.C.

Factory Acts

Bills for the amendment of the Factory Acts have been introduced into Parliament on several occasions, and in 1924, for the purpose of negotiations with the Government on the subject, the Association formulated a policy for the provision of a factory medical service. This policy proposed that instead of the present factory medical service there should be a complete Department of Occupational Hygiene attached to the Ministry of Health, the present service being transferred from the Home Office, and it was suggested that a trial should be made of delegating the administration of the work of occupational hygiene to local authorities. Such a scheme would promote the Association's ideal general medical service, in which all medical services controlled by the State would be administered by one Government Department. There is little prospect, however, of the early fruition of this ideal, and the Factories Bill which is now before a Parliamentary Standing Committee has been considered by the Association on the basis of the present system of administration. Representations have been submitted to the Home Office and the Ministry of Health on various clauses of the Bill with the object of securing improvements in the arrangements concerning health matters. The points raised include questions of safety and welfare, the ventilation and temperature of factories, the hours worked by women and young persons, the employment of pregnant women, and the medical examination of young persons to ascertain their suitability for employment in factories.

A great part of the efficiency of the factory medical service depends upon the work of the certifying factory surgeons, who are required to examine all young persons seeking employment in factories, to examine cases of industrial accidents and occupational diseases, and to make any other examinations required by the Home Office. There was at one time a proposal to abolish, for the purpose of national economy, the reports of certifying surgeons on accident cases on the ground that they were of little value and represented a duplication of the reports made by factory inspectors. The Association successfully resisted this proposal. It pointed out to the Home Office that reports of surgical cases required surgical knowledge and experience which the factory inspector did not possess, that as the factory inspector did not come into such close contact with the patient as did the certifying surgeon, he could not obtain such detailed knowledge of the facts of the accident and that it would be unwise, from a public health point of view, to abolish one of the principal safeguards of workmen against accident. No further action was taken by the Government, and the work of the certifying factory surgeon remains an essential part of the factory medical service.

Industrial Medical Officers

The Association's Medico-Political Committee recently appointed a special subcommittee to consider the position of the industrial medical officer or works doctor, who is playing an increasingly important part in the pro-

motion of the health and welfare of the working population. His duties are many and various. He examines applicants for employment, he examines and observes workers returning after a period of sickness and workers exposed to special dangers to health, he is responsible for the training and maintenance of the nursing and first-aid personnel, he advises the management on the hygiene of the factory and the health conditions of the workers, and he undertakes the instruction of the workers in health matters connected with their work. He is accessible to all employees, and supervisors are encouraged to report to him any signs of ill health in the workers under their charge. The works doctor, therefore, while not undertaking individual treatment except in emergency, shares with the general practitioner the care of the patient's health and the special subcommittee has submitted to the Council, a set of ethical rules for the guidance of the industrial medical officer in his relations with the individual's private medical attendant. These rules indicate the sphere of the industrial medical officer in respect of the individual patient and suggest procedure for consultation between the industrial medical officer and the patient's medical attendant and for the maintenance of professional secrecy.

The health of the industrial workers is frequently considered, incidentally, by other committees of the Association such as that which considered the provision of facilities for physical education and recreation, the Ophthalmic Committee, which is endeavouring to secure eyesight examinations by ophthalmic medical practitioners for all members of the community, and the Insurance Acts Committee but the questions of broad principle considered above illustrate how closely related are medicine and industry, and what beneficial results may be expected from co-operation between the Association and representatives of industrial workers.

MANIPULATIVE SURGERY AND OSTEO-PATHY. SOME OBSERVATIONS

B.M.A. LECTURE BY MR TIMBRELL FISHER

In a recent British Medical Association Lecture delivered to the Glasgow and West of Scotland Branch Mr A. G. Timbrell Fisher, orthopaedic surgeon to the St John Clinic and Institute of Physical Medicine and to the London County Council Arthritic Unit, St Stephen's Hospital, gave some observations on manipulative surgery and osteopathy. He began with a reference to the reorientation of medical thought which had been quietly taking place since the war with regard not only to the treatment of injuries and diseases of joints in their early stages but to the remote effects of such conditions and how they might be prevented.

Manipulative treatment offered great possibilities of relieving or curing the disabilities, often prolonged and unresponsive to many forms of physical therapy which resulted if the earlier treatment had been unsatisfactory. Such manipulative treatment had always been a recognized weapon in the armoury of the medical profession though there had been periods when its value had not been fully appreciated. Some sections of the lay press showed a very unfair and biased attitude to the position of the medical profession in this respect. The inference which the average layman would make would be that the medical profession had completely ignored the subject of manipulative treatment. This was very unfair to many in the medical profession who had laboured for years to place manipulative treatment upon a scientific basis.

It was only fair to state however that the interest of some medical men in this field was first stimulated many years ago by striking successes by bonesetters in cases which had defied orthodox treatment. Indeed, at a much earlier period bonesetters were achieving similar successes, and in 1867 Sir James Paget enunciated the precept "Learn then to imitate what is good and avoid what is bad in the practice of bonesetters." Paget's famous lecture entitled "Cases that Bonesetters Cure" did not escape severe criticism as being contrary to the truth handed down by the fathers of the art. At the very same time similar criticism was levelled against Lister when he described a new method of treating compound fracture but Listerian teaching presently carried all before it, whereas the medical profession, after listening to Paget respectfully went on with certain exceptions, treating joints in the old way, possibly because bonesetting was regarded as something not quite respectable.

Why Unqualified Practice has Flourished

In this way unqualified practice had been allowed to grow until it constituted a real danger. One principal cause was a defect in the method of medical education. Very few of the cases which bonesetters treated were properly studied by the medical students before qualification. The material used for teaching consisted of the more serious forms of illness or injury, and rare and obscure cases which the future general practitioner might never encounter were often sought by the consulting staff for teaching and examination purposes. Sprains and other injuries to joints were among the common conditions found in general practice and it was often such injuries, dealt with by inappropriate treatment, which were followed by chronic disabilities and led to the patients drifting into the hands of bonesetters or osteopaths. The practitioner was also handicapped by the doctrine of absolute rest for injured or diseased joints, which was the orthodox teaching until quite recent times and was still too frequent. Too prolonged rest for sprains and other injuries of joints, muscles, tendons or fasciae resulted in the formation of adhesions and the consequent pain and interference with function might be of long duration if adequate treatment was withheld. It would be to the advantage both of the future general practitioner and of the future consultant if students were given adequate instruction both in the prevention of adhesions and in the recognition of the cases which might benefit by manipulation. It was often overlooked that manipulative treatment was a highly specialized difficult and occasionally dangerous branch of orthopaedics and no medical man should undertake this work who had not received a thorough training preferably as clinical assistant to some orthopaedic surgeon.

Another reason why the irregular cults flourished was because the popular press was their friend. By means of such publicity some irregular practitioners acquired a quite unjustifiable reputation for infallibility and the possession of singular powers. The public did not know that there was another side to this optimistic picture and would be quite surprised to learn also that there were those within the ranks of the medical profession who had successfully specialized in manipulative work. A third reason for the popularity of unscientific systems of healing was the curious phenomenon of a persistent belief in magic even in an educated community. It was this which made the latest cult however absurd sure of a warm welcome from all classes.

Osteopathy

Mr Timbrell Fisher then turned to osteopathy and discussed its theory that all disease was due to an interference with the blood supply brought about by pressure upon the vasomotor system in the region of the spine, which pressure was associated with minor displacements or subluxations of vertebrae. If the osteopathic theory in its extreme form were harmless the cult might be

safely ignored and allowed to die a natural death, but unfortunately in some cases it was extremely dangerous. Osteopaths paid little or no attention to scientific methods of diagnosis. Consequently patients with malignant disease or other serious conditions often wasted precious time and incidentally much money in futile treatment while the conditions from which they were suffering steadily became worse and, in the case of cancer, inoperable.

Again it must be admitted however, that osteopaths sometimes effected cures in patients whose conditions had defied the more traditional methods. The fact must be squarely faced and an endeavour be made to ascertain how such cures were brought about. He divided such cases into three main categories. The first consisted of patients whose symptoms were actually situated in the spinal column or back and the cure was due to the breaking down of adhesions in ligament, muscle or aponeurosis. In the second category were patients whose symptoms were not actually in the spine but elsewhere, the symptoms being principally of the nature of a neurosis. Here came in the influence of suggestion and one of the cleverest and most effective forms of suggestion ever devised was the dramatic treatment of the osteopathic lesion. In the third category were patients suffering from pains often of a neuralgic nature, in various areas of the trunk and limbs. These were referred along the distribution of the anterior or posterior primary divisions of the spinal nerves owing to some pressure at their vertebral origin, often due to vertebral rheumatism or to the after effects of injury. Familiar examples were many cases of occipital neuralgia due to pressure upon the upper cervical nerve roots, some cases of brachial or intercostal neuritis causing pain in the upper extremity or chest, certain cases of obscure abdominal pain often wrongly diagnosed as due to some intra abdominal lesion and many cases of sciatica due to pressure at the exits of the corresponding spinal nerves.

When the osteopath manipulated the spine for any of the above conditions he might relieve or cure the patient. Without an exhaustive examination, however the risks of spinal manipulation were very great, and for this reason such manipulations should only be performed by an experienced surgeon. The treatment of these conditions really belonged to the realm of manipulative treatment proper, and the danger of building up a revolutionary system of medicine upon such a slender hypothesis, unsupported by scientific evidence, was self-evident.

Chiropractic

The assumption made by the chiropractors was that all deformities and diseases were due to displacements of vertebrae causing pressure upon intervertebral nerves. They alleged that such pressure caused interference with the normal flow of "vital force" from the spine to various parts of the body. But it was impossible for such pressure to occur without gross dislocations or displacements of vertebrae with indisputable radiographic evidence and such displacements would give rise to paralysis and other serious signs and symptoms. Furthermore it was a well known anatomical fact that the diameter of the intervertebral foramen considerably exceeded that of the nerve occupying it.

In conclusion Mr Timbrell Fisher asked what should be the attitude of the medical profession if as was probable another campaign was launched by the osteopaths for State registration and recognition. It was clearly a duty which the profession owed to the public to oppose strongly any official recognition of osteopathy for even a limited form of State recognition would be interpreted as a licence to diagnose and treat all forms of injury and disease with disastrous results to the standard of the common health. We shall not adopt this attitude from professional jealousy or prejudice but because it is our sacred trust as a profession to safeguard the health of the nation.

HOSPITAL POLICY OF THE B.M.A.

A meeting of the Hospitals Committee was held at B.M.A. House, Tavistock Square, on May 5 under the chairmanship of Dr PETER MACDONALD. The first part of the discussion was occupied in a preliminary consideration of the newly issued report of the Voluntary Hospitals Commission set up by the British Hospitals Association. The chairman recapitulated the principal points upon which the Association had given evidence and the committee had the advantage of discussing with Sir Henry Brackenbury, a member of the Commission, the views of the Commission upon these topics. It was generally agreed that the report was a very valuable one and that on the whole it reflected very fairly the views of the medical profession. There were however, certain omissions to which the chairman referred. The first he said, was the omission of any reference except incidentally, in relation to cottage hospitals to the desirability of some access for practitioners generally to treat their patients in hospital. Sir Henry explained that the subject which the Commission had been asked to consider was so vast that some questions not directly connected with it had to be left out and this was one of them. The Commission had considered the position in relation to cottage hospitals and to pay beds, but it had not touched the general question. The chairman referred to the admirable section on the out-patient department, and then passed to the question of the payment of staffs. A discussion followed on the general principle and on the paragraphs of the report where the principle was approved but with the suggestion that certain modifications or exceptions might be advisable. It was generally agreed that the report probably went as far as could be expected at the present moment. The Commission's comments on the question of pay-beds were considered to be entirely sound.

Attention was next given to the Commission's proposals for the reorganization of the voluntary hospital system of the country on a regional basis and for the establishment of a central council. Members of the committee regretted that the Commission had not found it possible to consider in more detail the nature or extent of the areas of the proposed regions. Sir Henry Brackenbury pointed out that in order to do so it would have been necessary for the Commission to undertake much detailed investigation and inquiry which was really beyond its reference and which would have needed more time than it had at its disposal. He thought, however, that this was a question upon which the B.M.A.'s co-operation might be very valuable in view of its long experience of local organization. He was sure that its assistance would be welcomed by the British Hospitals Association.

The committee concluded this part of its proceedings with an expression of its sense of gratitude to Sir Henry for his valuable work in educating the members of the Commission in the views of the profession, and in emphasizing the hospital policy of the Association.

Chiropodists and Foot Hospitals

Another subject which necessitated a prolonged discussion was the relation of the profession to what are known as foot hospitals. Sir Henry Brackenbury recalled the decision of the A.R.M. in 1934 to the effect that since the work of chiropodists in dealing with corns and callosities was already known and utilized the Representative Body did not approve of giving an official collective recognition to chiropodists in a more extended field. This decision was passed by a majority against the recommendation submitted by the Council. The Council had entered into communication with the one association which represented the most reputable section of chiropodists, and it decided that it would be wise in the circumstances then prevailing to try to define a field outside which chiropodists would undertake not to work and to give chiropodists a qualified recognition within that field. The

question was now raised again by the Lancashire and Cheshire Branch, which was disturbed by the growth of local foot hospitals. It was stated that many hospitals did not provide a chiropody service and yet there was public demand for it. This demand was being satisfied by foot hospitals some of which were good and some bad. The Branch felt that the Association should again review the situation, and provide some guidance for the profession on a very difficult question. The committee decided to consider the matter during the coming session from the hospital point of view with the object of re-submitting it to the Representative Body in 1938.

Radiological Services

Dr Russell Reynolds, chairman of the Radiologists Group Committee, attended the meeting to present some suggestions concerning radiological services. The first question concerned the use of hospital x-ray films and reports for litigation purposes. The Group Committee had formulated a series of resolutions which it asked the Hospitals Committee to consider with the object of preventing the exploitation of the services of radiologists in this respect. The committee discussed the matter from the point of view of both the radiologists and the other members of the hospital staff, and Dr Reynolds agreed to take back the Group Committee's resolutions for revision in the light of the present discussion. The Group Committee had also proposed that the Association should adopt a policy for the remuneration of whole-time non-resident junior assistant radiologists in hospitals and submitted certain figures for appointments in hospitals where only one assistant was employed and in hospitals where there were more than one. The committee considered that the Group Committee's object would be better achieved by a scale which would provide advantages in salary for seniority and length of service. Dr Reynolds undertook to submit this suggestion to his committee.

Other Business

Among a number of other matters on the agenda was a report that the Swaffham Cottage Hospital dispute was likely shortly to be settled and the question of the ophthalmic treatment at the out-patient departments of eye and general hospitals of persons who were entitled to receive ophthalmic benefit under the national health insurance system, the NOTB scheme, or contributory schemes.

The meeting concluded with a vote of thanks to the chairman for the able way in which he had presided over the committee's meetings during the session.

MATERNAL MORTALITY: TWO OFFICIAL CIRCULARS

The Minister of Health carries the attack on maternal mortality a stage further by the issue last week of new regulations prescribing the qualifications of supervisors of midwives appointed by local authorities. Besides other qualifications the supervisors, who may or may not be medical officers, must have had adequate experience in the actual practice of midwifery. In a communication to local authorities the Minister draws attention to the use in the regulations of the title 'supervisor' rather than 'inspector', and emphasizes the need for persons who in addition to the necessary professional qualifications and experience, possess the essential qualities of sympathy and tact so that they may be regarded as counsellors and friends of the midwives rather than as critics. The regulations apply specifically only to those appointed on or after June 1, 1937, but it is expected that the local authorities responsible for the supervision of midwives will review their existing arrangements and make any changes which may be desirable in view of the qualifications now

prescribed and the particular importance of making any such changes at the present time when the new national service of salaried midwives is about to be established throughout the country in pursuance of the Midwives Act, 1936.

In a further communication the Minister draws attention to the recently published report on maternal mortality and endorses its main recommendations. He urges each local authority to do all in its power to promote proper team work between health visitors, midwives and doctors whether in general practice or attached to hospitals or clinics, or obstetrical specialists, provision for whose services ought to be included in every scheme. Local authorities, acting where necessary in combination, should secure the establishment of 'emergency units' or 'flying squads' of skilled hospital staff to be available not only in the district of the hospital concerned, but within a wide area surrounding it.

The Minister also asks local authorities to review their arrangements for ante natal services and draws attention in particular to the importance of having in each area a consultative ante natal clinic, conducted by an obstetric specialist to which routine clinics and general practitioners could refer cases of difficulty. Post natal services the circular points out are also in need of further development and more post natal clinics should be set up preferably in association with a hospital gynaecological clinic so that diagnosis may be linked up suitably with treatment, which includes contraceptive advice where further pregnancy would be detrimental to health. The importance of an adequate supply of milk or other suitable food for women throughout pregnancy and for nursing mothers is once again emphasized. Every authority should consider the question of setting up a service of home helps, and dental treatment should be provided for expectant and nursing mothers. Local authorities are reminded of the need to persuade women of the importance of ante natal and post-natal care and certain suggestions are made to this end. The national campaign about the health services which will begin in the autumn will deal specially with this subject.

NOTES OF THE WEEK

Conference on Health Matters in Kent

A conference was recently held between representatives of the Kent County Council, the Kent Branch of the B.M.A., the Kent Medical and Panel Committee and the Kent Hospitals Consultative Committee to consider questions of mutual interest concerning the medical services of the county. The chairman of the Kent County Council presided. Among the matters discussed were the maternity services including ante natal care and the midwifery service, hospital provision and staffing and the domiciliary treatment of public assistance patients. It was generally felt that the conference had served a very useful purpose and the chairman said that at no time during the last ten years had there seemed to be so little difference of opinion among the conferring bodies. At the conclusion of the meeting Dr Watts on behalf of the Kent Branch of the B.M.A. expressed the hope that the Kent County Council would consider the advisability of forming a permanent advisory committee for the informal discussion of matters affecting the medical and health services of the county.

Air Raid Precaution Measures at Southend

The Air Raid Precautions Committee of the Southend Corporation has presented to the town council a report on the different precautionary measures which should be adopted. The committee appointed an advisory subcommittee which consisted of medical and lay members of the

former including a representative of the local Division of the B.M.A., and this subcommittee appointed three special subcommittees to consider respectively the provision of hospital accommodation, first aid posts and their staffing and of ambulance transport services. The recommendations of the committee were accepted by the town council.

Donations to Charities

The subscriptions and donations to the charitable funds of the profession which have been received by the Association during the first four months of this year amount to approximately £4,000. This total exceeds by about £100 the sum collected during the corresponding period last year.

Southampton Contributory Scheme

An agreement has been arranged between the Southampton Borough Council and the Southampton and District Hospitals Association for the payment to the council by the association of charges for treatment of contributory scheme patients in municipal hospitals in the area.

New Terms of Service in I.M.S.

New terms of service for European members of the I.M.S. to which reference was made in the *Journal* on April 3 (p. 735) have just been issued in booklet form. They may be obtained by intending applicants from the Secretary, Military Department, India Office, Whitehall SW1.

National Health Insurance in British Columbia

The contemplated national health insurance scheme for British Columbia has been postponed indefinitely, mainly on account of the opposition of the medical profession. The *Canadian Medical Association Journal* for April, 1937, remarks that the solidarity shown by the medical profession on the question surprised not only the Government and the public, but the doctors themselves. In a ballot taken of the views of the profession 96 per cent of the ballot papers were returned, 614 voting against the scheme and 13 in favour of it.

Dr J. G. McCutcheon, president of the Glasgow and West of Scotland Branch, was recently appointed a Deputy Lieutenant for the County of the City of Glasgow. This is an unusual honour to be bestowed upon a general practitioner and to mark their sense of appreciation of the distinction a number of his medical friends in the city entertained Dr McCutcheon at lunch on April 29.

On the occasion of his retirement from the office of chief consulting physician to the City of London Hospital for Diseases of the Heart and Lungs Dr E. H. Colbeck has been presented with a portrait of himself. Dr Colbeck joined the staff of the hospital forty-five years ago.

Dr C. D. Temple has received a presentation from the people of Comrie, Perthshire, to mark the completion of his fiftieth year of practice there.

Mr G. Forbes, lecturer in anatomy at Aberdeen University, has been recommended for appointment as police surgeon for Sheffield.

Dr P. Mullins of Bawtry, Yorkshire, has been elected a member of Bawtry Parish Council and of Worksop Rural District Council.

The Civil Service Clerical Association has approved a scheme for the erection of a new headquarters, the amenities of which will include a medical and dental service, an x-ray department and a hospital ward.

PUBLIC HEALTH NOTES

Education of the Deaf Child

By Section 42 of the Education Act, 1921, it is obligatory on "the parents of every child between the ages of 5 and 14 or, if a by law under this Act so provides, between the ages of 6 and 14, to cause that child to receive efficient elementary instruction in reading, writing, and arithmetic," a further section of the Act making it compulsory for the local education authority to take proceedings to enforce the duty of the parent. The responsibilities of both parties, however, are somewhat modified in the case of blind, deaf, defective, and epileptic children. In regard to the blind and the deaf child the duty of the parents includes that of causing the child to receive suitable instruction.

the fact of a child being blind or deaf (except in the case of a deaf child under 7 years) or the fact that there is not, within any particular distance from the residence of a blind or deaf child, any public elementary school which the child can attend shall not, of itself be a reasonable excuse for not causing the child to attend school or for neglecting to provide efficient elementary instruction for the child.

It is the duty of the local education authority to enable such of these children for whose elementary education efficient and suitable provision is not otherwise made to obtain that education in some school certified by the Board of Education as suitable. For the purpose of this part of the Act the expression "deaf" means 'too deaf to be taught in a class of hearing children in an elementary school'.

Under existing legislation, then, the education of the deaf child can be insisted upon only on his reaching the age of 7 years. This results, in some cases in the loss of two years of education in right methods at an age when the child is particularly susceptible to instruction. The Deaf Child (School Attendance) Bill, which would provide for the compulsory attendance at school of deaf children at the age of 5 years, passed through the House of Commons without opposition, and has now passed the second reading in the House of Lords.

Amended Rules of the Central Midwives Board

That section of the rules of the Central Midwives Board which governs the procedure for removal of a name from the roll has recently been amended, to take effect from April 1, 1937. *Early practice was that in any proceedings for the removal of a name from the roll the prosecutor was the secretary or other person appointed by the Board for the purpose, and not the local supervising authority which reported the midwife to the Board, the medical officer of health or inspector of midwives of the authority appeared as a witness called by the secretary as prosecutor, and not as a prosecutor laying an information before the Board.* More recently the local supervising authority has been empowered subject to certain conditions to undertake the conduct of the case if the Penal Cases Committee of the Board is satisfied that the case is one in which proceedings ought to be taken. Certain of the amendments of the rules are merely to correct inaccurate drafting of the latest issued rules. The following important subsections, however, have been added to Rule 10.

"The complainant and the midwife shall, subject to legal objection produce before the Board all documents within their possession or power respectively which may be required or called for and do all other things which during the proceedings on the charge the Board may require."

The witnesses called for or against the midwife shall, if the Board thinks fit, be examined on oath or affirmation."

"The Board shall have power to administer oaths to or take the affirmation of the witnesses called for or against the midwife."

"The complainant or the midwife may sue out a writ of subpoena ad testificandum or of subpoena duces tecum but

no person shall be compelled under any such writ to produce any document which he could not be compelled to produce on the trial of an action."

Disinfectants in Dustbins

Following the publication of the Dawes Report on the Public Cleansing Services in London, the Metropolitan Boroughs Standing Joint Committee set up a cleansing subcommittee, which has recently issued a report on the collection of house and trade refuse, street and gully cleansing and costing. In this reference is made to the common practice of sprinkling disinfectant powders in dustbins, and it is suggested that if proper use is made of the bin by wrapping wet refuse in paper and regularly washing the bin the disinfectant is unnecessary. Dr Lawrence Smith touches on the same subject in his report for the year 1935 as medical officer of health for the urban district of Carshalton.

'Considerable confusion exists' he states, 'as to the value of sprinkling dustbins with disinfectant powder. This process is even referred to as disinfecting dustbins' but nothing could be more grossly misleading or inaccurate. Such a process cannot disinfect the dustbin. What then, is the action of the powder used in this way? It cannot affect the contents of a bin since it does not come into contact with them, and any action it has can only be on whatever is adhering to the bottom of the bin. Even so it will only touch the surface layer of such matter and chemical disinfectants have practically no effect in the absence of moisture. The dusting powder by its odour, masks any undesirable smell the bin may have. In other words it acts as a deodorant. If a bin is so foul as to smell badly enough to need a deodorant it needs cleaning out. To mask such a smell only gives a sense of false security. If dustbins are used as they should be used—that is to say, kept dry and all refuse which can be burned burned on the fire or slow combustion stove—there should be no nuisance. It is conceivable that in very hot weather when there may be no domestic fires the contents of a bin even when care is exercised may begin to smell as the time for emptying approaches and in these circumstances the use of a deodorant may well serve some purpose.

Public Health Appointments

The following changes have recently taken place in the Public Health Service.

Dr E D Irvine, assistant medical officer of health for Blackburn, to be medical officer of health for Shipley.

Dr W D M Millar to be medical officer of health for Felling and Washington Urban District Councils.

Dr V R Walker deputy medical officer of health for Swindon, to be medical officer of health to the Borough and Port of Lowestoft.

Dr W Scatterty has resigned from the position of medical superintendent to Keighley, Bingley and Shipley Joint Hospital Board. Dr Scatterty has been medical superintendent at the board's hospital at Morton Banks since it was opened forty years ago. For thirty seven years he was medical officer of health for Keighley, retiring in 1928, and he is still medical officer to the Craven Combined Districts.

PRESENTATION TO DR. A. H. MACKLIN

Dr Macklin has intimated his resignation as Honorary Secretary of the Dundee Branch of the British Medical Association an office which he has held during the past seven years. All those who have come in contact with him have appreciated the services he has so efficiently and enthusiastically rendered during that time and his constant desire to further the interests and work of the Branch. The duties of secretaryship have entailed much time and energy and many wish to show their appreciation by subscribing to a presentation fund. Donations not to exceed 10s will be collected in Dundee, and country members are asked to send their contributions to Dr G A Rome 163 Princes Street, Dundee.

THE INSURANCE MEDICAL SERVICE WEEK BY WEEK

Partnership with a Non insurance Partner

In this column on April 3 (p 166) reference was made to a case which had been considered by the Insurance Acts Committee where it had been suggested that there might be objection to a partnership between a practitioner who was doing insurance work and another who was not. The following full note embodying a communication from the Ministry of Health will be of interest in this connexion.

A practitioner resigned from the committee's medical list at the end of last year in the hope of securing a hospital appointment as head of the department for the psychological treatment of nervous diseases to which appointment his having an insurance practice would have been a bar and he transferred his insured persons to one member of a firm of two practitioners (both under agreement with the committee) with whom he has remained in partnership. The doctor who resigned from the list wished to attend insured persons on behalf of his partners and the committee expressed the opinion that it is undesirable for a partner or partners of an insurance practitioner or practitioners not to be under contract to treat insured persons because of the possibility of misunderstandings and abuses arising in connexion with the treatment of insured persons by the non insurance practitioner or practitioners.

The committee also considered that as the doctor who resigned acts as a consultant it was conceivable that his partners might call him in as a consultant when he might not be the best specialist for the purpose. These representations were made by the committee in a communication to the Ministry who replied in the following terms.

The Minister is advised that there is no legal objection to the partner of an insurance practitioner not being under contract with the Insurance Committee and the Minister has no information which would lead to the conclusion that such a partnership is undesirable as tending to lead to misunderstanding and abuse. The Minister sees no ground on which exception could be taken to the giving of treatment outside the scope by the non insurance partner in the case of the partnership to which you refer. It appears to the Minister that if an insurance practitioner refers one of his patients to his non insurance partner for treatment outside the scope of an insurance practitioner's obligations under his terms of service no case could lie against the insurance practitioner unless it were shown that he had not faithfully discharged his duties under Clause 9 (1) of the terms of service and that if the non insurance partner had the necessary qualifications for undertaking the treatment, the fact that some other practitioner might be better qualified would not necessarily indicate non-compliance on the part of the insurance practitioner with the requirements of Clause 9 (1).

A Salaried Partner

An insurance practitioner recently intimated to the committee that he had taken another practitioner into partnership. On being asked whether the terms of the partnership agreement conformed to the requirements of the proviso to Clause 11 (8) of the terms of service he stated that under the partnership agreement his partner is not entitled to any stated share of the profits but is actually in receipt of a salary which together with certain allowances amounts to a sum greater than one third share of the profits* of the partnership. The committee sought the opinion of the Department as to whether the conditions laid down could be considered as complying with the definition of partner under the terms of service for insurance practitioners.

The Department replied that although there was nothing in the information given which necessarily negated the existence of a partnership it might be desirable for the

It may be noted that the provision in the terms of service is not one-third of the profits but one third of the share of any other partner.

Insurance Committee to satisfy itself as to the position by an examination of the deed of partnership if any. The practitioners were not willing to submit the deed of partnership but the principal partner reiterated that the partner whose status was in question was actually in receipt of a salary, and that such salary together with certain allowances amounted to a sum greater than one third share of the profits* of the partnership. The Department in the course of a further reply, said that if as was assumed, the expression 'salary' meant merely a fixed sum payable out of the profits so long as the profits were sufficient to meet it, there would appear to be nothing to indicate that a partner did not exist.

THE COURT OF INQUIRY INTO THE CAPITATION FEE

The Right Hon Lord Amulree GBE, KC LL.D., who is chairman of the Court of Inquiry set up by the Government to report on the appropriate capitation fee for insurance practitioners, has been the chairman of a large number of Government committees of inquiry. He was president of the Industrial Court, chairman of the Railway National Wages Board, and chairman of the Royal Commission on Licensing Laws. He has acted as arbitrator and conciliator in industrial differences for the Board of Trade and Ministry of Labour.

Mr Thomas Howorth, A.C.A., is a chartered accountant and a member of the firm of Price, Waterhouse and Company.

Mr D H Robertson M.A., is Reader in Economics in the University of Cambridge and Fellow and Lecturer of Trinity College, Cambridge. He is a member of the Economic Advisory Council.

The terms of reference to the Court of Inquiry were printed in full in last week's Supplement (p 272).

Naval, Military, and Air Force Appointments

ROYAL NAVAL MEDICAL SERVICE

Surgeon Captains J H Burdett to the *Pembroke* for Royal Naval Hospital Chatham. J D Danson to the *Victory* for Royal Naval Hospital Haslar.

Surgeon Lieutenant Commanders J B Patneke to the *President* for course. C D D de Labilliere to the *Pembroke* for Royal Naval Barracks.

Surgeon Lieutenant J M Fitzpatrick's seniority has been ante dated to July 23 1935.

Surgeon Lieutenants W B Taylor to the *President* for course. J G Vincent Smith to the *Pembroke* for Royal Marine Infirmary Chatham. I C Macdonald to the *Pembroke* for Royal Naval Barracks. D Simpson to the *Victory* for Royal Naval Hospital Haslar.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Sublieutenant R F Hand to be Surgeon Lieutenant. L F Donnan to be Probationary Surgeon Lieutenant.

ROYAL ARMY MEDICAL CORPS

Captains A McMillan and W G S Foster to be Majors. Lieutenants C P Stevens (with seniority August 27 1936) and J A G M Lynch to be Captains.

The appointment of Lieutenant C P Stevens is ante dated to August 22 1935 under the provisions of Article 36 Royal Warrant for Pay and Promotion 1931, but not to carry pay and allowances prior to May 1 1936.

SUPPLEMENTARY RESERVE OF OFFICERS ROYAL ARMY MEDICAL CORPS

G Robertson to be Lieutenant.

ROYAL AIR FORCE MEDICAL SERVICE

Squadron Leaders H W Corner to R.A.F. Depot Uxbridge for duty as Medical Officer. J Hutchison to R.A.F. Station Dhahran Iraq for duty as Senior Medical Officer. G W Paton to Aircraft Depot Hunsditch Iraq for duty as Senior Medical Officer.

Flight Lieutenant R C H Tripp to R.A.F. Station Upper Heyford.

Flying Officer F L Whitehead to be Flight Lieutenant.

Correspondence

CAPITATION FEE FOR JUVENILES ANOTHER ASPECT

SIR,—There is one aspect of the suggestion that the profession should attend young persons of from 14 to 16 years of age at a figure less than the standard capitation fee which seems to me to have received less attention than it deserves. In or about 1912, before the Ministry of Health was formed the Health Commissioners were considering the position of the old age pensioners under the N.H.I. Act. There were then no old age pensions at 65 but the statutory old age pension was payable to those attaining the age of 70. These old people then ceased to be entitled to such benefit, but the Health Commissioners were anxious that they should if possible remain in medical benefit. They approached the medical profession and asked if we would "as an act of grace" continue to attend this group of admittedly bad lives at the standard capitation flat rate. This we agreed to do and have done ever since and done I think I may say, fairly and conscientiously. The Commissioners contended at the time that this "act of grace" would not really amount to very much as there could not be many of these pensioners, and they could not in any case live very long—both of which opinions time has proved to be erroneous. Of the insured persons on my panel who were attended by me during the first three months of this year, 12 per cent. were old age pensioners—that is were 65 or more years of age.

The medical profession in its innocence believed that the principle of insurance consisted in taking, at a flat rate the good lives and the bad the former making up to us for the latter. The Ministry of Health's idea of the principle of insurance seems to be that when they have a group of admittedly bad lives the profession should accept these at the flat rate, but when they have what they believe to be a group of good lives—namely from 14 to 16 years of age—the profession should accept these at something less than the flat rate. In my opinion the Ministry is being neither fair nor just in even making such an offer. But if it insists on ignoring the principle of the flat rate and discriminates between young and old between good lives and bad then I maintain that for the latter we ought to be paid at a figure above the flat rate—I am, etc.,

Bury May 4

P. F. BRATHWAITE.

THE GENERAL PRACTITIONER AND MIDWIFERY

SIR,—Practitioners as a whole will welcome the memorandum of the Council of the Association (*Supplement* May 8 p. 269) which sets out how midwifery can be carried out with safety to the patient without preventing the practitioner doing the work for which he is trained. But if one admires the pronouncement of the Association how illogical is the attitude of those who would restrict the doctor in his ordinary activities? Certain practitioners on certain occasions have had unfortunate results in their midwifery work therefore no doctor is capable of doing this work.

But what would happen if we carried these principles of reasoning into other spheres of activity? In 1932 the infant mortality rate in London was 67 but in two boroughs the rate was 107 and 98 respectively. Would it be justifiable if one suggested in such circumstances that the medical officer of health in each case was unable to perform his duties? Would it not at once be pointed out that there were many other factors involved? And if one went further on the same lines, would it be so unreasonable to suggest that because of these two relatively poor figures no medical officer of health should be allowed to go on with infant welfare work? Is this any more sweeping than the present arguments on the other side regarding midwifery work?

The organized medical profession might with advantage consider whether what is threatened in midwifery practice to-day is not exactly what has happened in infant welfare work in recent years without any organized protest having been raised. Certain doctors do not do this work or do not

do it very efficiently, therefore all this work must be taken away from the general practitioner and done by local clinics.

It is quite time that the whole position regarding encroachments was considered by the profession—I am, etc.,

YORKSHIRE BRANCH SHEFFIELD DIVISION—At Church House St James Street Sheffield Tuesday, May 25 8.30 p.m. Annual general meeting Election of officers

Meetings of Branches and Divisions

FIFE BRANCH

The second clinical meeting of the year of the Fife Branch was held in Kirkcaldy Station Hotel on April 1 when Mr ARCHIBALD MCKENDRICK (Edinburgh) gave an address on Medical Reports and Workmen's Compensation Acts. Dr G. M. FYFE, president of the Branch, was in the chair.

The lecturer said that in making a report the examiner should confine himself to a statement of the facts observed, noting them as he would demonstrate the case to a class of students. He should be particularly careful with regard to complaints to note the nature of the injuries complained of, the exact locality, the area affected and the mode of onset. Patients often made misleading statements with regard to injuries and their cause. Intentionally misleading statements gave rise to suspicion of malingering. This question might or might not be very difficult but it was very important to establish a clear case to stick to facts and to ignore unfavourable impressions produced by the demeanour of the complainant. In head injuries it was essential to ascertain if the patient lost consciousness and the duration of any unconsciousness. In limb injuries both limbs should be examined and the differences noted. The girth of a limb was important.

A discussion took place on various points dealt with in the address, such as time of onset of osteomyelitis after trauma the stiff joint, and the aggravation of pre-existing disease by injury.

A vote of thanks to Mr McKendrick for his address was moved by Dr G. W. McIntosh and was cordially endorsed by everyone.

NORTH OF ENGLAND BRANCH NORTH NORTHUMBERLAND DIVISION

At a meeting of the North Northumberland Division, held at Belford on April 21 the following officers were elected for the ensuing year:

Chairman Dr J. A. McLeod Vice-Chairman Dr B. W. E. Trevor Roper Honorary Secretary and Treasurer and Deputy Representative in Representative Body Dr D. T. McDonald Representative in Representative Body Dr R. A. Welsh

Arrangements were made to hold meetings of the Division on the following dates during the year: May 26, June 23, July 7, September 15, October 20 and November 17. The date of the annual dinner was not fixed but will be arranged on a suitable date in the autumn.

POST-GRADUATE NEWS

The Fellowship of Medicine announces the following courses: thoracic surgery at Brompton Hospital May 24 to 29; urology at St Peter's Hospital May 31 to June 12; gynaecology at Chelsea Hospital June 14 to 26; children's diseases at Princess Elizabeth of York Hospital May 29 and 30; general medicine June 5 and 6 and general surgery June 19 and 20 both at Prince of Wales's General Hospital; obstetrics at City of London Maternity Hospital June 12 and 13.  SUNDERLAND ROYAL INFIRMARY—(1) H.P. (2) Two H.S.s (males) Salaries £120 p.a. each
 SURREY COUNTY COUNCIL—(1) A.M.O. (male) Salary £600-£20-£700 p.a. (2) Whole time Dental S. Salary £500 £20-£600 p.a.
 TAUNTON AND SOMERSET HOSPITAL—H.P. Salary £100 p.a.
 TIPTON URBAN DISTRICT COUNCIL—M.O.H. and School M.O. Salary £800 p.a.
 VICTORIA HOSPITAL FOR CHILDREN Tite Street, S.W.—Physio-therapist Honorarium £50 p.a.
 WEST HAM COUNTY BOROUGH—Second A.R.M.O. (male) for Central Home Leytonstone E. Salary £350 £25 £450 p.a.
 WEST LONDON HOSPITAL Hammersmith Road W.—(1) J.A.M.O. for the Venereal Diseases Department Salary £350 p.a. (2) H.P. (3) Two H.S.s Males Salaries £100 p.a. each
 WOOLWICH AND DISTRICT WAR MEMORIAL HOSPITAL Shooters Hill Hill S.E.—(1) Surgical Registrar Honorarium £100 p.a. (2) Three Hon. Anaesthetists
 WORKSOP VICTORIA HOSPITAL—(1) Senior Resident (2) Junior Resident. Salaries £150 p.a. and £120 p.a. respectively
 YORK COUNTY HOSPITAL—H.S. to the Eye Ear Nose and Throat Department Salary £150 p.a.

To ensure notice in this column advertisements must be received not later than the first post on Tuesday mornings

Notifications of offices vacant in universities medical colleges and of vacant resident and other appointments at hospitals will be found at pages 47 48 49 50 51 52 53 and 56 of our advertisement columns and advertisements as to partnerships assistant ships and locumtenencies at pages 54 and 55

APPOINTMENTS

GOW H. M.B. Ch.B. Certifying Factory Surgeon for the Newbury District (Berkshire)
 OVENS G. H. C. M.B. B.S. F.R.C.S., Surgical Registrar St Mary's Hospital W.
 RENOALL S. S. M.B. B.S. Medical Referee under the Workmen's Compensation Act 1925 for the Boston Holbeach Steadford Spalding, Spilsby and Skegness County Court Districts (Circuit No. 17)
 WOODROOPE P. Esq. M.B. Ch.B. Honorary Anaesthetist Royal Halifax Infirmary
 KING'S COLLEGE HOSPITAL Denmark Hill S.E.—Senior Assistant Radiologist A. M. Rackow M.B. B.S., D.M.R.E. Junior Assistant Radiologist Bryan G. Thompson M.D., D.M.R.E.

BIRTHS, MARRIAGES, AND DEATHS

The charge for inserting announcements of Births Marriages and Deaths is 9s which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue

DEATHS

BROWN—Robert Story Brown M.B. B.S. beloved husband of Martha Jane Brown on May 6 at Lane House Bootle Cumberland aged 60 years
 STANLEY TURNER—On April 1st suddenly at Newgate B.C., Canada Harry Philip Stanley eldest son of Wing Commander H. M. Stanley Turner M.D., F.R.S.E., R.A.F. Buried at Roseville B.C.

paroxysmal crises of hypertension has been quite recently established. This condition contrasts with the persistent hypertension seen in some tumours of the adrenal cortex. (iv) Adenomas of the parathyroid glands were associated in 1904 by Askanasy with von Recklinghausen's generalized osteitis fibrosa cystica, but this was not definitely recognized until 1926. (v) Adenomas or hyperplasia of the islands of Langerhans (hyperinsulinism) give rise to spontaneous hypoglycaemia, a morbid state which was not recognized until 1924 by Seale Harris, after it had been produced by the administration of insulin to animals and described early in 1923 by Banting, Campbell and Fletcher before insulin was available in this country.

Parathyroids

Though described in man and animals in 1880 by I. V. Sandström of Upsala University, the parathyroid glands did not attract any attention until 1891 when Eugène Gley of Paris independently described them in animals. At first they were regarded as accessory thyroids, but Kohn (1895) stated that they are anatomically and physiologically distinct from the thyroid, and in 1909 MacCallum and Voegtlin proved that they control calcium metabolism and that their removal is followed by tetany. Before the recognition of the parathyroids some of the symptoms following total thyroidectomy, which were really due to simultaneous removal of the parathyroids, were ascribed to removal of the thyroid. The isolation and standardization of a powerful parathyroid extract by Collip (1925) and the association of hyperparathyroidism, due to adenomatous change in the parathyroids with generalized osteitis fibrosa cystica (1926) are milestones in the physiology and pathology of the parathyroids.

Multiglandular Syndromes

The conception of inadequacy of several endocrine glands was initiated in 1907 by Claude and Gougerot, and was followed in 1908 by that of the interaction and interdependence of the endocrine glands or the endocrine balance brought forward by Eppinger, Falta and Rudinger. The idea of multiglandular syndromes—namely, co-existent primary disturbance of more than one endocrine gland—met with considerable criticism. The position has been altered and clarified by the discovery of the controlling influence of the anterior pituitary over the other endocrine glands, by means of its thyrotropic, adrenotropic, gonadotropic, and other hormones.

The Pituitary

The pituitary, now the predominant endocrine gland, was later than the adrenals and the thyroid in attracting modern investigation. For in 1889, in a review of nervous physiology it was dismissed as having little if any use in the organism of the higher vertebrates, and in the same year Alexander Macalister, professor of anatomy at Cambridge, described it as 'probably the rudiment of an archaic sense organ. Like the thyroid and pineal, it was known to Galen, Vesalius (1543) believing that it collected waste material (*pituita* = phlegm, slime) from the brain and in some way conducted it into the nasopharynx, gave it what is still its familiar name, although a century later C. V. Schneider and Richard Lower destroyed the basis for such a title. Soemmerring (1778) called it the hypophysis. Like the pineal or epiphysis it was thought to be concerned in the regulation of the cerebro-spinal fluid by Sylvius of Leyden and Vieussens in the seventeenth century, and even as late as 1842 by Magendie.

Pierre Marie in 1886 gave the clinical account of acromegaly which in the following year was connected with the pituitary by Minkowski, and thus directed attention to the gland, but it was not until this century, especially since 1905, that its physiology and pathology were exhaustively investigated, particularly by Harvey Cushing whose epoch making work *The Pituitary Body and its Disorders* appeared in 1912. The pituitary now bears much the same relation to the other ductless glands that the brain does to the remainder of the nervous system. Unlike the thyroid, parathyroids, and adrenal medulla, which each secrete one hormone only, the pituitary has been thought to manufacture an increasing number of active principles or hormones—the anterior pituitary as many as fourteen and the posterior seven—but doubt has been expressed, especially by Abel (1924), whether each different action of pituitary extracts is necessarily due to a separate hormone. The pituitary hormones chiefly, if not entirely, act by stimulating other endocrine glands, the thyroid, adrenals, gonads.

Thus hyperpituitarism—hyperplasia and correspondingly increased secretion of eosinophil or of basophil cells in the anterior pituitary—may be followed by similar reactions in the adrenals, gonads, and thyroid. It has been suggested, but not proved, that the thyroid changes in exophthalmic (or toxic) goitre are primarily due to excessive secretion of the thyrotropic hormone by the anterior pituitary. On the other hand hypopituitarism due to disease, for example, by infarction as in pituitary cachexia (Simmonds's disease, 1914), or to experimental hypophysectomy is followed by atrophy not only of the dependent endocrine glands but of the body generally. The interrelations between the anterior pituitary and other endocrine glands are at any rate in some instances, reciprocal, thus castration gives rise to the cellular changes known as 'castration cells,' and the corpus luteum of pregnancy causes the formation of 'pregnancy cells' in the anterior lobe of the pituitary.

The Islands of Langerhans

The islands in the pancreas, described in 1869 by P. Langerhans were in 1893 named after him by Laguesse, who with Hédouin in that year concluded that the islands provided the internal secretion of which the experimental production of fatal diabetes mellitus by excision of the pancreas in 1889 by von Mering and Minkowski had shown the existence. In 1902 Opie described hyaline degeneration of the islands in diabetes mellitus. In the next twenty years there were several attempts to treat diabetes mellitus by pancreatic extracts especially by Zuelzer in 1908, but these preparations produced such severe reactions from the contained proteins that they were abandoned. The hormone was named 'insuline' in advance (before it was obtained protein free in 1922 at Toronto) by de Meyer in 1910 and independently by Schäfer in 1916. After first calling their hormone 'letin,' Macleod, Banting and Best in 1922 adopted the slightly modified name insulin.

The Gonads

Though from the eighteenth century the gonads were vaguely thought to exert what is now recognized as an endocrine influence and although the first experimental evidence of a testicular and indeed of any hormonal function dates back to Berthold in 1849 further scientific advance in this direction is of quite recent origin. During the last few years the output of scientific investigation

has been enormous, so much so that the practical application of this new physiological knowledge has not had time to keep abreast. The sex hormones and their relations to the anterior pituitary have thus been recognized, and their extreme complexity especially of the female hormones has become manifest. Probably the services of organic chemistry are now more important here than in any other branch of endocrinology.

Methods of Endocrine Research

These comprise (1) Correlation and comparison of the clinical features with the morbid changes in the endocrine glands the method employed by Addison. With this may be associated observation of substitution treatment—namely, the clinical effect of (a) administration of an extract of the gland damaged or rendered inadequate by atrophy or disease or (b) removal of a gland considered to be over-active such as the thyroid in exophthalmic goitre or of an adrenal in the adrenogenital syndrome. (2) Experimental removal of normal glands and, when symptoms have been thus produced grafting the same gland into the animal or by giving extracts of the gland parenterally. (3) The new method of extending over successive generations of animals either (a) excision of the endocrine organ or (b) administration of its extract. Employing this technique Rowntree, Hanson, and their co-workers have brought forward evidence to show that the thymus (1934) and the pineal (1936) are endocrine glands controlling growth and sexual development. (4) The isolation, crystallization, and synthesis of hormones by organic chemists a comparatively recent and most important line of advance.

Neuro-humoralism

The vegetative portions of the animal body appear to be controlled by a double or alternative mechanism—namely by nervous and by chemical messages. In 1904 T. R. Elliott suggested that nervous impulses of the sympathetic may act on the effector cells at the periphery by the liberation of adrenaline. In 1906 W. E. Dixon found that a heart submitted to vagal stimulation liberated a body which inhibited the frog's heart; this hypothesis was followed up by Loewi (1921), Dale (1929), and Cannon (1933) and Dixon's inhibitor has been called 'vagal substance', acetylcholine, and parasympathin. Acetylcholine therefore stands in much the same relation to the parasympathetic as adrenaline does to the sympathetic division of the autonomic system.

In this short essay on the history of endocrinology it was inevitable that reference should be made to what is happening to-day. The future historian of the subject indeed may look upon to-day as the most important and fruitful period in the development of a science to which the clinician has made such valuable contributions. What these are is plain to the reader of the previous articles in the series which fill the many large gaps in this survey and bring the story of endocrinology up to the present moment.

Nova et Vetera

THE CORONATION AND A DISUSED RITUAL [FROM A CORRESPONDENT]

The practice of touching for the king's evil is no doubt as dead as Queen Anne, the last of our monarchs to essay the therapeutic art. Yet for all those who decline to regard history as 'bunk', any matter which was for centuries closely connected with the sovereignty of England cannot in this year of the King's crowning be without interest.

In 1911, the year of the Coronation of King George V, a scholarly series of lectures was delivered by Sir Raymond Crawford before the Royal College of Physicians and subsequently published by the Clarendon Press under the title of *The King's Evil*. Since the publication of this volume there appears to have been no further detailed investigation of the subject. It seems opportune therefore, to gather up and supplement the result of these earlier researches.

History of the Practice

In England the beginning of the practice may be reckoned as dating from the reign of Edward the Confessor, who died in the year 1066, though in France the ceremony is referred back to the Coronation of Clovis in A.D. 496. It began soon to be debated by the chronicler William of Malmesbury and the monks whether the Confessor had cured by virtue of his own holiness or whether the power had been transmitted to him by his royal ancestors. These healings seem at first to have been of many diseases—leprosy, plague, jaundice, and possibly tubercle—and from the large numbers touched at later dates it must surely be inferred that the term 'scrofula' was extended to cover not only glandular swellings of the neck, but swellings of any kind in any part of the body. Evidence of the practice is lacking during the reigns of William II, Henry I, and Stephen. It was revived by Henry II, but there is no evidence that John or Richard I ever touched—the latter King being very little in England. With Edward I we are on firmer ground, for the House hold accounts (1277-8) of that monarch show for 17 sick persons signed by the King 17d., and in one month he touched 533 persons. During the fifteenth century there are few cases recorded, but Henry VII restored the practice and added a new ceremony, giving to each person an angel—a gold coin with the figure of St. Michael on the obverse. The service employed, together with others, has been preserved and there was little alteration in the forms until the rite was finally discontinued after the death of Queen Anne, except that after the Reformation the office was said in English and some few markedly Roman Catholic characteristics such as the invocation of the Virgin Mary and the Saints were omitted. The words of the first Gospel, "They shall lay their hands on the sick and they shall recover," were repeated by the chaplain so long as the King was handling the sick persons. The concluding words of the second Gospel, "That was the true Light which lighteth every man that cometh into the world," were similarly repeated "as long as the King shall be crossing the sore of the sick person with an Angel Noble and the sick person is to have the same Angel hanged about his neck and to wear it until he be full whole." The dissolution of the monasteries by Henry VIII led to a large increase in the numbers of the sick poor for whom there was now no provision, and—though there is no certainty that Edward VI touched—this led to a great number attending the court both of Mary and of Elizabeth to obtain relief. Queen Mary's Manual formerly in the possession of Cardinal Manning contains three miniatures: (1) showing the Queen blessing cramp rings; (2) a crucifixion; (3) the Queen clasping the swollen neck of a boy with both hands.

The Paris Academy of Surgery has awarded the international Lannelongue medal of surgery to Dr A Lambotte honorary professor of the Brussels Faculty of Medicine, for his work on bone surgery.

CARE AND AFTER-CARE OF THE TUBERCULOUS

CONCLUSION OF EMPIRE CONFERENCE

The Empire Conference on the Care and After-care of the Tuberculous the first three sessions of which were reported last week at page 987 concluded its discussions on May 5 with contributions from various countries, but especially India and East and West Africa, on tuberculosis control in those regions

Surgical Tuberculosis

Sir HENRY GAUVAIN discussed some problems of surgical tuberculosis. Conservative treatment, he said, was the procedure of choice in most cases of surgical tuberculosis, with a few rather striking exceptions. For example in tuberculous disease of the knee joint in an adult after perhaps three months conservative treatment, excision should be practised. With regard to tuberculous glands of the neck, the treatment had given rise to some controversy. Some surgeons advocated immediate excision. On the other hand many tuberculosis officers followed a conservative treatment. Actually the method depended on the individual needs of the patient. If there was one large fluctuating gland and it was aspirated it would probably heal without difficulty, but if there was a mass of glands the patient should first of all have conservative treatment. He advocated fixing the neck with a light metal carapace which gave the patient a chance of resting his back. Light treatment should be applied in very even minimal doses and in that way and with fixation the glands might disappear completely. Even if they did not disappear they became more discrete, and it was easier to excise them after three months trial of the resting method. The procedure of excision should be regarded as a major operation. Sir Henry Gauvain also touched on a tuberculous condition of which, he said, more and more was seen—tuberculous glands of the mesentery. Here again the ideal treatment was rest. An important point was careful dieting and avoidance of roughage in diet.

Tuberculosis Control in Scotland

Dr ERNEST WATT representing the Department of Health for Scotland after outlining the successful history of the anti tuberculosis campaign in Scotland, said that there were now beds in the proportion of 1 to 900 of the population distributed over some 112 institutions. With regard to after-care and the very important matter of supervision of contacts the latter should not be limited to child contacts if success was to be assured. Supervision must be continued throughout young adult life at least. Was it over ambitious to suggest that the dossier of each member of a contact family should contain an x-ray film of the chest for purposes of comparison when, later in life sickness or any suspicious condition occurred? Observations along similar lines should be extended to the young adult contact or other entering upon factory or scholastic life.

Modified colony and workshop conditions had been in operation at two centres in Scotland. The opinion had been expressed that Scotland's problem in this respect did not justify expansion along village settlement lines. An outlet had been found at Papworth and Preston Hall for a number of colonists from Scotland and so long as such an outlet was freely taken advantage of further development in Scotland would not be justified. In the after-care of the ex sanatorium patient the orthopaedic specialist service in the industrial parts of Scotland would give second place to none and even in the most outlying areas a very satisfactory service was available.

This account from Scotland was followed by some remarks by ISABEL MARCHIONESS OF ABERDEEN, president of the Women's National Health Association in Ireland,

who described in particular the establishment of the two sanatoriums at Peamont, near Dublin and at Rossclare, near Enniskillen.

Tuberculosis Control

After a brief discussion on the resettlement of the tuberculous ex soldier to which Dr J. B. McDougall and others contributed Dr G. LISSANT, central tuberculosis officer Lancashire read a paper on the scheme for control of tuberculosis in the County Palatine. He described it briefly as based on the principles of 'find isolate, educate and treat the adult positive case'. From 1914 to 1935 the death rate from pulmonary tuberculosis in the administrative county had fallen from 0.87 to 0.46 per 1,000 of population and from non pulmonary tuberculosis from 0.32 to 0.10.

Dr L. S. T. BURRELL briefly discussed the function of the hospital in the tuberculosis problem, and also gave some account of the growth of the work at Brompton. In his view the hospital had three functions: to treat the early case and prepare for sanatorium treatment; to deal with the serious case of advanced disease, largely for the protection of the community; and to serve as a centre for diagnosis. Lord HORDER said that Dr Burrell might have added a fourth function that of teaching.

Dr PHILIP ELLMAN said that despite advances such as artificial pneumothorax and thoracic surgery the problem of the relapsed case still remained. He gave three reasons for relapses: (1) the return to bad home conditions; (2) insufficient attention to nutrition after discharge from the sanatorium; (3) the stress of competition in the employment market. He deplored the policy of some local councils whereby the last person to be given a council house was the ex-tuberculous patient. Institutional treatment was only one aspect of the case, the continuing care and safeguarding of the patient was above all necessary.

India and the Near East

Dr P. V. BENJAMIN of South India gave the results of a tuberculin survey of 3,000 individuals in the Chittoor district near Madras. The positive reactors numbered over 40 per cent among adults and 11 per cent among children. Lately with the rapid growth of communications and the springing up of crowded industrial centres the tuberculosis problem in India had received a new aspect of urgency. The fact that practically only one type of acute exudative disseminated pulmonary tuberculosis was met with rather suggested that much of the disease might be due to auto inoculation brought on by undue stress or unfavourable environment. Sir CUTHBERT SPRAWSON, Director General I.M.S., said that as a whole the native population of India was more susceptible to tuberculosis than that of Great Britain and the disease in India often tended to run a more acute course. He urged the establishment of tuberculosis colonies or settlements. If every city with a population of 100,000 or over were to start a tuberculosis settlement just outside the municipal limits with accommodation and arrangement for expert treatment of all types of tuberculosis a great step would be taken towards the improvement of public health.

Mr NORMAN H. MACLENNAN representing the Department of Public Health Palestine, recounted the conditions in that country. The figures for tuberculosis could only be adduced on the basis of the death rate in the seventeen principal towns of Palestine. On this basis the mean average death rate for 1930-4 from tuberculosis was 5.16 per million population the pulmonary form accounting for 387. The disease in Palestine reached an endemic importance equal to that experienced in England and it seemed probable that the incidence was increasing. From the scanty historical information available the disease had been present for centuries in Palestine. In the past its effects had been confined more or less to the large urban

communities, but the unparalleled development of Palestine of recent years had deprived the rural communities of their isolation, and promoted an extension of the disease among them. The incidence of the disease and the mortality from it was greatest among the Mohammedan community.

The African Races

Dr. CHARLES WILCOCKS representing the medical services of Tanganyika Territory, addressed the conference on the tuberculosis problem in Central Africa. Of the five million native population, mostly of Bantu origin, in Tanganyika a large proportion of those who died did so without having been treated by a qualified medical practitioner. They lived under primitive conditions, of which he gave a vivid description but the conditions were changing rapidly under the influence of education, and the people were now frequently finding employment away from their homes. In a survey with tuberculin of representative groups he found out of 9,866 examinations, 114 cases of definite tuberculous disease, and there were over 50 per cent positive reactors. The higher tuberculin rates were found in the districts of densest population. The great majority of cases were infected by the human type, there were very few cases of bovine infection. His conclusion was that tuberculosis was present throughout Tanganyika, and the natives could not be regarded as virgin soil.

Dr. A. D. PRINGLE whose previous communication on the European populations of the Transvaal and Natal was summarized in the last issue supplemented it by some account of the care and after-care of the tuberculous native, and other contributors to the discussion, which ranged over tuberculosis throughout the Empire, were Dr. J. CAUCHI of Nigeria who dealt with tuberculosis in West Africa, Dr. G. M. C. POWELL of Northern Rhodesia, Dr. R. B. MACGREGOR of the Straits Settlements, and the Hon. FRANCIS GAHA Minister of Health for Tasmania. Mr. Gaha stated that his Government was about to establish a full time free medical service for people living in the remoter parts of the State. It was not intended to place medical officers in these remote regions and leave them there—they would be drafted back to the cities at frequent intervals for refresher courses in hospitals as resident medical officers.

After this full exchange of experiences and views, extending over three days those attending the Conference paid visits to Brompton Hospital and the Papworth Settlement.

MEASUREMENT IN EXCELSIS

WORK OF THE N.P.L.

The report of the National Physical Laboratory¹ appears this year in a new dress—royal octavo instead of quarto—and is of only half its usual bulk, being much more handy and readable. The work of this great institution at Teddington which employs about 700 persons, is carried on in eight departments, in all of which a vast amount of general research and routine testing is done. As an instance of the refinement to which measurement is now carried a description is given of what is probably the most accurate experiment ever completed. Its object was to confirm or otherwise the theory of relativity whereby it is impossible by physical measurement to detect the motion of the earth through the ether of space. The experiment consisted in comparing the period of vibration of a quartz rod with that of a similar oscillator placed successively in a series of different positions so that its axis was rotated through 360 degrees. The fact that the general theory of relativity was confirmed seems much less impressive than the

extraordinary accuracy whereof no difference in period exceeding four parts in one hundred thousand millions could be detected.

Estimation of Noise

On a less ethereal plane the institution has been doing a great deal of work on the measurement of noise. It has been investigating for the Ministry of Transport the noise from mechanically propelled vehicles under varied conditions of use. A noise meter has been developed which gives dial readings corresponding to aural loudness of noises, including those of an intermittent and impulsive character. Tests have shown that motor cycles are in general the worst offenders, with some sports cars and commercial vehicles not far behind in nuisance value. A noise level of 90 phons—the phon being a unit of equivalent loudness recently set up by the British Standards Institution—is recommended as a limit which should not be exceeded by new motor vehicles. Sound insulation in buildings has also received attention, and such conclusions as that the insulating value of a solid wall can be increased appreciably by the application to both sides of plastered building board fixed to battens, or that partitions of lath and plaster or fibre board on each side of wooden studding are superior to single partitions of the same weight, are of value in a period when people live and work in ever closer proximity.

Work in Radiology

The National Physical Laboratory continues its useful work in radiology—the term here including the industrial as well as the medical uses of x-rays. X-ray diffraction or crystal analysis investigations are beginning to find a wide application in industry. One piece of work along this line which is of medical interest is the x-ray study of tooth structure undertaken for the Medical Research Council. This study has shown that the main crystalline constituent of the enamel is identical with that of the underlying dentine, but that while the crystallites in the dentine are arranged at random there is a marked fibre structure in the enamel and that a high quality of enamel is associated with a well marked fibre structure. It appears that in the case of the enamel the calcification is the more marked the later the enamel is formed in the life of the tooth, while the opposite holds for the dentine.

The work done in optics has found a useful application for the protection of the x-ray worker from the dangerous stray radiations emitted from modern radiation plants. A viewing system consisting of spherical mirrors arranged on each side of a massive protecting wall is being tried so far with satisfactory results. The patient can be clearly viewed through an aperture in the wall 3 in. in diameter several feet above the head level of the observer, so that he may carry on his work in perfect safety. Further work has been done on the approximation of x-ray and radium measurements, and it has been found that the röntgen—the unit of x-ray quantity introduced by international agreement in 1928—can equally well be used for gamma measurements. The quantity of gamma rays produced from one milligramme of radium filtered by one half millimetre of platinum amounts to 7.8 röntgens an hour at one centimetre from the source. It has also been shown that small closed ionization chambers similar to those used in x-ray work may be employed to measure the dose from a radium source if suitable precautions are taken. Thus there is resulting a unification of x-ray and radium dosage measurements—an important conclusion from the point of view of the medical radiologist. The amount of radium measured by the laboratory during the past year was 8½ grammes in some 1,100 containers. Since the beginning of its work it has measured 130 grammes of radium or one-fifth of the world's estimated supply. The amount of radium now in Great Britain is believed to be about 100 grammes of which about one quarter is owned by the National Radium Trust.

REFORM OF MEDICAL CURRICULUM

DEBATE IN EDINBURGH

A discussion, attended by over 200 students and others, regarding changes that might with advantage be made in the training of medical students, took place in the Edinburgh University Union on May 6. Sir FRANCIS FREMANTLE chairman of the Parliamentary Medical Committee, in opening the discussion said that even in present-day medical education there was a faulty idea in pathology, for the causation of disease did not always begin with the condition of the individual and of the invading organism as found in hospital. The cause ought to be traced back to the home, school, or factory, and to the whole life and surroundings of the individual which had originally enabled the cause to arise, the germ to breed or the patient to be susceptible. At present the patient after treatment returned home with only the crudest general advice as to how he should fight the same conditions again. The cause, treatment, after-care and prevention of disease were therefore of the first importance, and in this the dispensary system that prevailed in Edinburgh could be of enormous value in teaching. Some change in the system of examining medical students was also required. Both the General Medical Council and the British Medical Association recognized that the student should be judged not merely by his facility in passing an examination but by his record of work in quantity and quality, and by the intelligence he had displayed throughout his period of study. The General Medical Council in 1936 had finally adopted resolutions which would come into force in 1938, but these resolutions had been originally suggested in 1922, and very little had been done to put them into effect. Something far quicker and more effective than the GMC's slow, quiet, toning up of medical education was necessary if the medical student was to face future needs as well as the present limited requirements of his professional life. As at present constituted the GMC consisted, with few exceptions of men saturated with the limited outlook of thirty years or more ago. Moreover, the natural tendency of Parliament was to leave the medical profession to manage itself, and this was done at present by the heads of the various medical corporations. He concluded by saying that reform must come from the individual medical schools. Edinburgh University had an exceptional opportunity—it had made a splendid start by its keenness on the subject—to lead those in England and to lead the whole world.

THE CURRICULUM AND THE GENERAL PRACTITIONER'S NEEDS

Dr G. O. BARBER of Cambridge University and St Mary's Hospital speaking on 'The Standpoint of the General Practitioner' said that the medical student had little opportunity of realizing how greatly different the day's work of a general practitioner was from the training he received in hospital. The public had a touching faith in the letters which a newly qualified man wrote after his name, and believed that any student who had successfully passed examinations was qualified to look after his patients in health and illness. In actual fact such letters showed that the student had achieved a high standard in a number of disconnected academic scientific subjects. For this however and for the present system no blame rested upon the teachers themselves for they were bound partly by tradition and partly by the recommendations of the General Medical Council with regard to the conduct of examinations. The medical student's attitude towards what he was taught was largely 'Will this help me to pass my examinations?' instead of 'Will this eventually help my patients?' Dr Barber believed that more time should be allowed for the student to learn how to think and how to teach himself and that there ought to be less cramming. Systematic lectures should be re-

duced and their practical application should be increased. In certain scientific subjects, such as anatomy, physiology, pathology, and bacteriology, some of the demonstrations should from the first be of a clinical nature in the hospital itself. Such an innovation would enormously increase the interest of the student and would enable the teacher to stress the application of his subject and to curb theoretical discussions which were of merely academic interest.

The speaker also thought that a more up-to-date body than the General Medical Council to guide the whole of medical education was necessary. The General Medical Council should contain a much larger proportion of men versed in the needs of the general practitioner for at present there were only seven men elected by the great body of general practitioners while of these only two he believed, had ever engaged in general practice. Dr Barber considered that the scientific subjects should be taught to a greater extent in their reference to general practice—for example anatomy should be taught only as it was applicable to the living body. In Edinburgh fuller use might be made of the dispensaries with which this city was well provided to give students some idea of what general practice was like. He believed that if some such changes were made general practice would take its rightful position as one of the highest branches of medicine instead of being regarded as at present, as a branch for mediocre and unambitious people.

SOME CRITICISMS ANSWERED

Professor SYDNEY SMITH dean of the Faculty of Medicine in Edinburgh University spoke to some extent in reply to criticisms which had been made of the present curriculum. He said that every member of the medical faculty was ready to alter and improve his course as seemed necessary. He considered that the curriculum of Edinburgh University was years ahead of anything that had developed south of the border. The great reduction that had taken place in present day mortality figures as compared with figures at the beginning of the century was a proof that their study of preventive medicine had been intensive. The maintenance of the health of the individual was stressed right through the curriculum and the recently established chair in Edinburgh of child life and health was specifically devoted to the problem of the child and of keeping him in health. Speaking of the preliminary scientific subjects, he hoped that in future medical students would spend considerable time on the subjects of chemistry, botany and physics at school before they came to the University. It had already been proposed in Edinburgh that anatomy and physiology should run together, with an increase in the amount of time given to physiology and a diminution in that given to anatomy and also that throughout the later stages of the course the clinical applications of physiology and anatomy should be studied in the wards of the hospital. He did not agree that medical students were over-worked but nevertheless it was intended in Edinburgh to ease the studies of the third year. It was also proposed that the amount of clinical work should be increased by two terms and that the long summer vacation should be shortened.

The discussion was finally summed up by Dr CHALMERS WATSON who said that Sir Francis Fremantle's plea for a definite reorganization of the curriculum strongly commended itself as well as his suggestion that a progressively minded university should give a pioneer lead at the present time. It was in accordance with tradition that Edinburgh should play that part, for the University had already given much consideration to the subject and it was gratifying to learn from the dean of the Medical Faculty that changes had already been contemplated to meet the new conditions. It had been said that medicine had come to a new birth and he would like to observe that if the birth was not to prove a stillbirth it must arise out of an appropriate marriage between what was best in the curative medicine of the past with

what was best in the preventive medicine of the future Tradition died hard, and the enthusiasm of each teacher for his own special subject was boundless and might require to be curbed Medicine should be regarded both as a science and an art, and the development which had been foreshadowed by the dean of the Faculty would enhance the students knowledge of both Other schools would no doubt follow Edinburgh's lead in this matter The speaker shared the views already expressed regarding the advisability of reorganizing the controlling body of medical education

THE CORONATION HONOURS LIST

An Honours List, issued on the occasion of the Coronation of His Majesty King George VI, was published on May 11 as a Supplement to the *London Gazette* of May 7 The list contained the names of the following members of the medical profession

Baron

The Right Hon CHRISTOPHER ADDISON P.C. M.D., F.R.C.S. First Minister of Health 1919-21 Parliamentary Secretary to the Ministry of Agriculture 1929-30 and Minister of Agriculture 1930-31 For political and public services

Baronet

Sir CUTHBERT SIDNEY WALLACE, K.C.M.G., C.B. D.Sc., M.B., F.R.C.S., President of the Royal College of Surgeons of England

K.C.B. (Civil)

EDWARD MELLANBY M.D. F.R.C.P. F.R.S., Secretary, Medical Research Council.

K.C.V.O.

Sir JOHN ATKINS K.C.M.G. M.B. F.R.C.S., Physician in Ordinary to H.R.H. the Duke of Connaught
GEORGE FREDERIC STILL, M.D., F.R.C.P. Consulting Physician Hospital for Sick Children, Great Ormond Street.

K.B.E. (Military)

Air Vice Marshal ALFRED WILLIAM IREDELL, C.B. M.R.C.S. F.R.C.P. Director of Medical Services R.A.F. Honorary Physician to the King.

A.B.E. (Civil)

The Honourable JOHN RICHARDS HARRIS M.D., Minister of Public Instruction and Minister of Public Health State of Victoria.

Knighthood

ARTHUR FREDERICK HURST D.M. F.R.C.P. Senior Physician to Guy's Hospital

HAROLD BECKWITH WHITEHOUSE M.B. M.S., F.R.C.S. Professor of Midwifery and Diseases of Women in the University of Birmingham

ARTHUR EDWIN HORN C.M.G., M.D., M.R.C.P. Consulting Physician to the Colonial Office

C.B. (Military)

Surgeon Rear Admiral GUY LESLIE BUCKERIDGE O.B.E., M.R.C.S., L.R.C.P., Honorary Surgeon to the King.

Major General OSBURN JEVERS D.S.O., M.B. late R.A.M.C. Honorary Surgeon to the King Deputy Director of Medical Services, Southern Command

Major General HENRY MARRIAN JOSEPH PERRY O.B.E., late R.A.M.C., Honorary Surgeon to the King Director and Professor of Pathology Royal Army Medical College

Major-General WILLIAM HAYWOOD HAMILTON C.I.E., C.B.E. D.S.O., F.R.C.S., I.M.S. Honorary Physician to the King, Deputy Director of Medical Services Northern Command India

Air Commodore ALBERT VICTOR JOHN RICHARDSON O.B.E., M.B., B.Ch., D.P.H., R.A.F. Honorary Surgeon to the King.

C.B. (Civil)

JOHN HARRY HEBB, C.B.E., M.B., B.Ch. Director-General of Medical Services, Ministry of Pensions

C.M.G.

ROBERT HENRY HOGG O.B.E. M.B., President of the New Zealand Branch of the British Medical Association.

C.I.E.

Colonel JOHN TAYLOR, D.S.O., M.D., I.M.S. Honorary Surgeon to the Viceroy of India, Director, Central Research Institute Kasauli

Lieut.-Colonel CLIVE NEWCOMB B.Ch. D.M. M.R.C.S. L.R.C.P. F.I.C., F.C.S. I.M.S., Chemical Examiner to the Government of Madras, and Principal, Medical College, Madras

Lieut. Colonel RONALD HERBERT CANDY M.B., B.S., M.R.C.S., L.R.C.P. I.M.S. Civil Surgeon Poona, Bombay

ERNEST MUIR, M.D. F.R.C.S.E. LL.D. General and Medical Secretary, British Empire Leprosy Relief Association

C.B.E. (Military)

Surgeon Captain WILLIAM BRADBURY D.S.O. M.B., B.Ch., R.N.

Colonel JOHN HEATLY SPENCER, O.B.E., M.D., F.R.C.P., late R.A.M.C. Honorary Physician to the King Professor of Tropical Medicine Royal Army Medical College and Consulting Physician to the Army

C.B.E. (Civil)

EDGAR LEIGH COLLIS M.D., M.R.C.P., Emeritus Professor of Preventive Medicine in the University of Wales, Member of the Miners' Welfare Committee

GEORGE CARTER COSSAR, M.C. L.R.C.P. and S.E.D., L.R.F.P.S. Glas. Founder of the Todhills Farm Colony and the Craigelinn Training Farm for the Training of Boys in Agriculture

JAMES PERRINS MAJOR M.D. B.S. Honorary Secretary of the Victorian Branch of the British Medical Association Honorary Local General Secretary of the 103rd Annual Meeting of the British Medical Association, Melbourne September 1935

PETER SINCLAIR HUNTER, M.B. Municipal Health Officer, Singapore Straits Settlements

JAMES LOCHHEAD O.B.E. M.D. F.R.C.S. Colonial Medical Service, Senior Medical Officer Gibraltar

O.B.E. (Military)

Surgeon Commander JOHN WYLIE, M.B. Ch.B., R.N.

Surgeon Captain JAMES BRUCE RONALDSON V.D., M.D., R.N.V.R.

Major DAVID FETTES M.B. F.R.C.S.E. R.A.M.C.

Major FRANK HOLMES M.B. R.A.M.C.

Captain TREVOR EDWARD PALMER M.B. I.M.S. late Medical Officer British Legation Guard Addis Ababa Abyssinia

Wing Commander ALAN FILMER ROOK M.R.C.P. M.R.C.S., D.P.H., R.A.F.

O.B.E. (Civil)

Alderman OWEN WYNNE GRIFFITH, L.R.C.P. L.R.C.S., J.P. Eleven times Mayor of Pwllheli and forty four years member of the Town Council

CHARLES RALPH COOKE-TAYLOR, M.R.C.S. L.R.C.P. For political and public services in Dulwich

DAVID HYND M.B. Ch.B. Raleigh Fitkin Memorial Hospital Bremersdorp Swaziland For social welfare services

Major GEORGE MAYNE MOFFATT L.R.C.P. and S.I. I.M.S. Civil Surgeon, Lashio Northern Shan States Burma

Lieut.-Colonel JOHN RODGER M.C., M.B. I.M.S., Chief Medical Officer in Baluchistan

Lieut.-Colonel PAUL HERBERT SHELLEY SMITH M.B., B.Ch., I.M.S., Superintendent, Central Jail, Harpur (Hazara), North-West Frontier Province

JOHN MERRILL CRUKSHANK, M.D., Colonial Medical Service Chief Medical Officer and Resident Surgeon Bahamas

JOHN DANIEL HARMER, M.B., F.R.C.S. Colonial Medical Service Surgical Specialist Health Department Northern Rhodesia

Mrs DOROTHY MARY ROBERTS M.B. For social services in the Straits Settlements

GEORGE WAUGH SCOTT M.D. For public services in the Federated Malay States

I.S.O.

HERBERT RENDELL, M.B. C.M., formerly Superintendent of the Tuberculosis Sanatorium, Newfoundland

M.B.E. (Military)

1st Class Assistant Surgeon ARTHUR NORMAN DE MONTE, M.C. Indian Medical Department.

Lieutenant (Senior Assistant Surgeon) HAROLD JAMES CLARKE FLANAGAN Retired late Indian Medical Department.

Captain ALISTAIR GORDON DONALD WHYTE, R.A.M.C. For valuable services rendered in the field in connexion with the operations in Palestine during the period April-October, 1941.

M.B.E. (Civil)

MISS HARRIETT BIFFIN M.B. M.S. For charitable and social welfare services in the State of New South Wales
THOMAS BERTRAM BUTCHER, M.R.C.S. L.R.C.P. Honorary Surgeon Superintendent, Cottage Hospital Mussoorie United Provinces

MAJOR FRANCIS JOSEPH D. ROSE Indian Medical Department Civil Surgeon and Superintendent of the Central Jail at Myaungmya Burma.

BIRENDRA NATH GHOSH L.M.S., F.R.F.P.S. Medical Practitioner Bengal

BARJOR FRAMJI KHAMBATTA M.B., B.S., D.P.H. Port Health Officer Karachi Sind

MAJOR JOHN MICHAEL PEREIRA Indian Medical Department (retired) Superintendent, Patna Medical College Hospital Bihar

PERCY WILLIAM BARNDEN M.R.C.S. L.R.C.P. For social services in Nigeria

ATUL CHANDRA DUTTA, L.M.S. Lately Medical Officer, Malacca, Straits Settlements

Kaiser i Hind Medal (First Class)

JEHANGIR ARDESHIR ANKLESARIA M.B., B.S. D.P.H. D.T.M., Port Health Officer Rangoon Burma

ST JOHN AMBULANCE BRIGADE

Jubilee Celebrations

The St John Ambulance Brigade will celebrate its jubilee this year immediately after the Coronation, beginning with a reception at St John's Gate, London, on May 14. The Brigade was formed in 1887 in order to give members of the St John Ambulance Association greater opportunities for putting their knowledge of first aid and nursing to practical test and by its connexion with the Order of St John of Jerusalem is part of the oldest order of chivalry in the world having its origin in the eleventh century. The Brigade has now grown to a strength of 101,917 men, women, and cadets in this country and over seas from where many will be making long journeys to attend both the jubilee celebrations and the Coronation. Representatives will come from many parts of the British Empire. The Queen who is Commandant-in-Chief of the Nursing Corps and Divisions, will take part in the jubilee celebrations by reviewing the Brigade in Hyde Park on May 22.

The arrangements in addition to the reception and the great review, include May 18 garden party at St. James's Palace given by the Grand Prior H.R.H. the Duke of Connaught. May 21, jubilee first aid competitions at the Great Central Hotel, prizes distributed by H.R.H. Princess Alice. May 23 service at St. Paul's attended by H.R.H. the Duke of Kent. May 25 investiture at Buckingham Palace by H.M. the King. May 29 to 30 intensive air raid precautions course for over seas at Great Central Hotel.

Surgeons-in Chief

The first Surgeon-in-Chief was Sir William MacCormac Bt. P.R.C.S. who was appointed to that post in 1896 though he had been in the St John movement from the time when the association (which teaches examines and certifies lay persons) was born and joined the Brigade at its origin. Then followed Edmund Owen F.R.C.S. of St. Mary's Hospital who was Chairman of Council of the British Medical Association 1905-10 next Sir William Bennett F.R.C.S., for fifteen years then Colonel C. I. Ellis A.M.S.T. (1931-6). The present Surgeon-in-Chief is Dr. N. Corbet Fletcher of Hampstead a general practitioner who on his promotion last year had already had twenty years service with the Brigade and is credited with several authoritative manuals on first aid and home nursing.

An Argentine Society of the History of Medicine has recently been formed in Buenos Aires under the presidency of Dr. Ramon Pardo, its special purpose being the study of medicine in America.

Local News

ENGLAND AND WALES

Centenary of Liverpool Medical Institution

The programme has now been issued for the centenary celebrations of the Liverpool Medical Institution on Sunday, Monday, and Tuesday, May 30, 31, and June 1. At the cathedral service on Sunday at 3.30 p.m. the preacher will be the Bishop of Glasgow and Galloway, and at 3.45 p.m. members of the Guild of St. Luke Cosmas and Damian will meet at the Catholic Cathedral site for benediction after which they will join the others for tea at the Medical Institution. At the centenary meeting on Monday at 3.30 p.m. honorary membership is to be conferred upon Sir Cuthbert Wallace, President of the Royal College of Surgeons of England. Sir Norman Walker, President of the General Medical Council. Sir E. Farquhar Buzzard, President of the British Medical Association, Sir Ewen Maclean, President of the British College of Obstetricians and Gynaecologists, Professor W. Fletcher Shaw, President of the Manchester Medical Society, Sir James Barr, Mr. C. Thurstan Holland and Mr. Frank T. Paul. The new honorary members will be introduced by Professor John Hay, and congratulations will be offered to Dr. Hugh A. Clarke on the attainment of his jubilee of membership. Professor R. E. Kelly will then give his presidential address, entitled *Surgery 100 Years Ago*. The centenary dinner will be held at 7.30 at the Adelphi Hotel. On Tuesday at 3.30 p.m. the opening of the Hugh Owen Thomas and Robert Jones Memorial Library of Orthopaedic Surgery will be followed by the Hugh Owen Thomas Memorial Lecture by Mr. W. Rowley Bristow, President of the British Orthopaedic Association. At 9 p.m. the Lord Mayor of Liverpool will give an *At Home* in the Town Hall with dancing till midnight.

University of London Medical Graduates

The annual dinner of the University of London Medical Graduates Society was held on May 6 in the new University buildings in Bloomsbury, Dr. Dorothy Hare presiding over a large number of members and guests. The health of the society and its president was proposed by Mr. H. Lightfoot Eason. In a characteristically witty speech he welcomed Sir St. Clair Thomson as the "well known gynaecologist" who had been present at the birth of the society in his house in 1927. Sir St. Clair he said was known not only in England but all over the world, and it was a pleasure to them that he would be present in the Abbey at the Coronation as a representative of the Royal College of Physicians. The University of London Medical Graduates Society had been created for purely social reasons to promote the interests of the faculty of medicine in London. In coupling the name of their president with the toast of The Society, Mr. Eason said that Dr. Hare was a worthy representative of the society and all that it stood for. Thanking Mr. Eason for the way in which he had proposed the toast Dr. Hare said that this was a red letter day in its short history for they were holding their dinner in the new hall of the University. She would like to thank Colonel Brook and his staff for the efficient way in which the entertainment had been conducted. The society she continued owed a great debt to the outgoing secretary Dr. Louise Livingstone and to Mr. John Hosford who would continue in office. She would also like to express their indebtedness to the treasurer Mr. Philip Mitchiner and to extend a welcome to Sir Charlton Briscoe who would shortly be the new president. She was glad to be able to record that this year the society had received official

recognition from the University of London. The society stood for adhesion to the University and cohesion among its members, of whom there were now over 700, including many over seas. The health of the guests was proposed in a short speech by Sir Charlton Briscoe, and Mr W. Girling Ball replied.

New Antitoxin Establishment for London

It is proposed to set up at Queen Mary's Hospital, Carshalton at a cost of £116,000, a new antitoxin establishment designed and equipped on modern lines. The London County Council has hitherto depended on the laboratories at Belmont, Sutton, which were built thirty years ago, to deal with the preparation of diphtheria antitoxin and of materials used in the diagnosis of diphtheria for the hospitals controlled by the former Metropolitan Asylums Board. Since the Council assumed control the work carried out at Belmont has been extended to the preparation of other products with the result that although there have been some extensions of the building the accommodation is inadequate. It is expected that the provision of the establishment at Carshalton will assure the County Council of a constant and ample supply of the products now being prepared at Belmont, as well as of others that are being purchased, with the important additional advantages resulting from research which will become possible in new forms of specific and preventive treatment. The space required for the preparation of the products at present issued and those required to meet the anticipated increase in the demands for them is estimated at twice that of the existing laboratory. The Belmont laboratories will be retained for work which can conveniently be carried out there.

SCOTLAND

Lectureship in Psychopathology at Aberdeen

Aberdeen University Court, at a special meeting recently, accepted a gift of a capital sum from an anonymous donor for the foundation of a part-time lectureship in psychopathology. It was a condition of the gift that the lecturer should not be an alienist, and that his clinical work be done in the Royal Infirmary. Among other benefactions intimated was a gift of £500 from Lord Glanely to permit research in rheumatism.

Deaconess Hospital, Edinburgh

At the annual meeting of the Church of Scotland Deaconess Hospital Edinburgh Sir John Fraser, professor of clinical surgery in the University said that this hospital illustrated in its work the beauty of what he might call practical Christianity. Religion and medicine were very fitting partners in life's work, and this was the reason why many members of the medical profession were staunch admirers of the great work done in this hospital. There was evidence now of a growing tendency to accept the principle that the State should make itself responsible for the care and maintenance of the sick. The present was not a time to discuss the ethics of that question. There was much to say in favour of it, but the very thought brought into prominence the privilege of giving voluntarily. Therefore while there was still time, they should share in the joy of voluntarily supporting hospitals, and aiding in hospital activities by all means in their power. Mr J. A. S. Millar chairman of the Hospital Board, recalled that the reopening of the Deaconess Hospital after reconstruction last December had been the last public function performed by the King and Queen as Duke and Duchess of York. The scheme of reconstruction would cost about £42,000, and towards that sum £36,000 had been received.

Correspondence

The Oxford University Appeal

SIR.—At a meeting of members of the Oxford Medical Graduates Club recently held in London to consider how they might best assist the Oxford University Appeal, the opinion was expressed that many medical graduates would like to be associated together in any contribution which they might make towards the appeal. It has therefore been arranged that a special fund will be opened to include the contributions from all medical graduates who may so desire it, the names of individuals being of course retained. It is felt that, in this way, the medical graduates of Oxford will be able more adequately to express their gratitude to their University and their desire to come to her assistance.—We are, etc.,

E. FARQUHAR BUZZARD
President

R. C. JEWESBURY
Hon. Secretary

May 3

Blood Transfusion in Obstetrics

SIR—I have read Dr Malcolm D. Black's communication on blood transfusion in obstetrics in the *Journal* for May 1 (p. 903) with some interest, the more so because active efforts, in the shape of the provision of 'flying squads' and transfusion services, are being made to deal with serious cases of haemorrhage among women delivered in their own homes. With such efforts directed towards saving women who have had severe haemorrhage at childbirth I am in natural sympathy. Common sense alone would appear to dictate blood transfusion along the lines suggested and in the type of case cited by Dr Black, but are we doing all we can to avoid the haemorrhages which call for such treatment?

When I was appointed to the Dudley Road Hospital, Birmingham, in 1932, I dealt with eighteen cases of severe post-partum haemorrhage, with collapse, in my first half-year. None of the patients died and none was transfused, all were delivered in the hospital. During the four and a half years since then there have been three cases only among the same class of patient, again without a death. Twenty cases were sent to the hospital following delivery at home during the same period, there were two deaths and one of the patients had a ruptured uterus. The hospital deals with from 1,200 to 1,500 confinements and 600 to 700 abortions a year.

On investigating the eighteen cases that occurred in the first half-year, I found that the whole trouble could be attributed to faulty management of the third stage of labour, which culminated in the loss of the retroplacental haematoma from one edge of the placenta too early, leaving the remainder of the placenta attached. In other words, when the haematoma has been conserved until the whole of the placenta has been hydraulically lifted off, all is well.

Dr Black advocates transfusion before any attempt is made to deal with the placenta or the products of conception in abortion cases. I have stated (*Journal* 1935, 1, 78) that separated placental tissue is, of itself, shock-producing. Mangled or dying tissue anywhere in the body will lower the blood pressure steeply until it is removed. When that is done the patient's pulse shows a constant and welcome recovery in twenty minutes or less and rectal salines and absolute quiet are then all that

are required Dr Black comments on the number of deaths as between the period when there was no proper transfusion service (the average of the five years 1930-4 was 21.4) and the year 1935 when such a service was instituted, and there were sixteen deaths. The smallness of this drop should be noted by everyone in charge of clinics comparable in scope with the Glasgow hospital to which Dr Black is attached. He has the kind of results that may be obtained in cases of desperate need, however quickly the transfusion is given or rather made available.

While an active supporter of the kind of work that Dr Black is doing, I feel that there is even more to be done in the way of disseminating knowledge of the real physiology underlying the separation and expulsion of the placenta, from which the management of the third stage of labour follows as a corollary. Further all perineal lacerations following operative delivery should be immediately sutured, thus avoiding confusion as to the source of the bleeding. If the placenta is not expelled naturally an anaesthetic should be given and the placenta expressed or removed manually. In my own experience covering nine years spent in large maternity hospitals I am convinced that the best time for transfusion to improve the patient's general condition is the fifth or sixth day of the puerperium. With Dr Black's remarks on placenta praevia I am in full agreement—I am, etc.,

WENTWORTH TAYLOR FRCSI, MCOG
Birmingham, May 4

SIR—Dr Malcolm Black is to be congratulated on his admirable survey of blood transfusion in obstetrics in the *Journal* of May 1 (p 903). The experience at Leeds Maternity Hospital confirms that of Dr Black. The improvement of the maternal results in placenta praevia since blood transfusion has been freely resorted to is striking. Before 1931 the annual number of transfusions recorded never reached ten, from 1922 to 1930 260 cases of placenta praevia were treated in the hospital and twenty-eight of these patients died (10.8 per cent). In 1931 there were eleven transfusions in 1932 and 1933 eighteen each and in 1934 twenty-five from 1931 to 1934 177 cases of placenta praevia were treated and four of these patients died (2.3 per cent). Figures later than 1934 are not available. Since 1931 the Leeds Blood Transfusion Service has kindly provided most of the donors. The only alterations in the obstetric treatment of placenta praevia since 1930 have been the introduction in 1932 of Willett's forceps as the method of choice and an increase in the incidence of Caesarean section. No doubt Willett's forceps should share with blood transfusion the credit for the improved results.

I am glad to see that Dr Black stresses the value of blood transfusion in the patient's home in certain cases. I am convinced that the transfer to hospital kills some patients who are in a state of collapse from haemorrhage and brings others near to death. The flying squad advocated and introduced by Professor Farquhar Murray at Newcastle can save many lives and has been strongly recommended in the recent report on maternal mortality published by the Ministry of Health.

I think the best form of transfusion service is one whose members are available to give blood in any emergency whether medical surgical or obstetric. I do not know what is done in Glasgow when donors are required for say surgical cases but it would surely be uneconomical to have two services with two office staffs and two sets of the necessary stationery in one city. The Leeds service was modified from those of London and Birmingham. The hospitals pay the service a small sum

for the donors used and private patients each pay a fee of five guineas. The fees are used to meet service expenses as the donors as a body have refused to accept any remuneration for what they give—I am, etc.

Leeds May 3

ANDREW M. CLAYE.

Treatment of Tetanus

SIR—I have read with great interest Dr Yodh's paper (*Journal* April 24 p 855) on the treatment of tetanus in which he has published further results with repeated doses of antitoxin given by the cisternal combined with other routes. My own results in a small series of thirty consecutive cases treated almost entirely by one single large dose of antitoxin (usually 200,000 international units) given intravenously are perhaps of sufficient interest to quote. Out of thirty patients seventeen recovered and thirteen died, a mortality rate of 43.3 per cent (Dr Yodh 438 cases, mortality 50.6 per cent). Five of these cases were extremely severe and the patient died within twenty-four hours of admission; three others were severe cases in men over 60 whose general physique gave no chance of recovery from tetanus. If these eight cases are excluded then there was recovery in seventeen out of twenty-two a mortality rate of 22.7 per cent. It should be added that however much earlier these eight cases had come under treatment nothing could have saved them. In my experience this applies in most cases in which the patients die within twenty-four hours of admission so that their exclusion is liable to give a false idea of the mortality rate. In my series there were no cases of purely local tetanus.

Dr Yodh quotes me as saying that he (Dr Yodh) in his previous paper (*British Medical Journal* 1932, 2, 589) did not give the incubation periods. My exact words were "but does not give exact details of incubation periods" (*Quart J Med New Series* 4 298). Dr Yodh classified his cases into groups with incubation periods of one to five, six to ten, and eleven or more days. My point is that in assessing prognosis the exact incubation period and even more important the exact period of onset are of the greatest value. The prognosis in a series of cases with incubation periods of six or seven days is much worse than in a series with incubation periods of nine or ten days. The same applies to a period of onset of two days as compared with one of three.

In attempting to compare the results of two methods of treatment of tetanus it is most important to take two series of cases in which the incubation periods and periods of onset are as near as possible identical, which are as similar as possible in other respects, and in which apart from tetanus the patients are physically fit. I believe that a very careful study of smaller groups of patients on these lines would yield information of considerable value. Tetanus is such a variable disease that unless this method of control is used the results obtained in different series of cases are bound to be conflicting—I am, etc.

Cambridge May 5

LESLIE COLE

Rectal Injuries from an Enema Nozzle

SIR—Mr Walter W. Galbraith's paper on rectal injuries in the *Journal* of April 24 (p 859) justifies the following records.

CASE 1

A healthy single woman in her forties with a huge ovarian cyst complained only of her abdominal enlargement and the playful taunts of her friends. The operation was timed for 10 a.m. but the matron of the home told me that the patient had complained of rectal pain following the admini-

tration of an enema the previous evening, and suggested postponement of the operation to allow of the possible after treatment

On examination a small spot of redness not more than a sixpence in circumference was found at the edge of the anus. It suggested an inflamed pile and I agreed to postpone the operation. At 6 p.m. on the same evening I was horrified to find a raised erysipelatous rash extending all over the buttocks and perineum, and up to the small of the back and well down her thighs. Over the perineal region there were black gangrenous streaks. The patient was removed to the isolation hospital where prompt surgical treatment involving extensive incisions did not prevent gangrene and sloughing of the rectum and perirectal tissues.

Some three months later she again came under my care, and I found a funnel shaped somewhat wide opening leading up from the perineal area to the end of the rectal tube some three inches higher up. Local plastic repair was out of the question. I removed the ovarian cyst, and was astonished to find no evidence of any inflammatory reaction in the floor of the pouch of Douglas with which the lower pole of the cyst was in contact. A colostomy was performed later.

CASE II

This patient was a maternity hospital case," and had a laceration involving the perineum and rectum. It was repaired. She complained of severe pain following the administration of an enema. The subsequent history was one of cellulitis sloughing, septicaemia pyaemia and death. It was generally believed that the nozzle of the enema had either perforated the rectal wall or had in some way penetrated a stitched laceration.

These two cases have convinced me that even in expert hands the rigid nozzle is inadvisable, and in the hands of probationers and untrained women positively dangerous. I always insist that enemas are given by means of either a catheter or a rectal tube, the pliability of the rubber will reduce to the minimum the risks of the procedure. Mr Galbraith has called attention to a most important matter. I share his abhorrence of the rigid nozzle of the enema syringe—I am, etc.,

Newcastle upon Tyne May 3

FARQUHAR MURRAY

Cancer of the Breast

Sir—In the *Journal* of February 6 certain questions were put forward by Dr Gilbert Scott bearing on cancer of the breast. These appear to me very much to the point and worthy of consideration. Each week I have been hoping that someone more able than myself might attempt to supply some of the answers, instead there has been an exchange of personalities.

The answer to Dr Scott's first conundrum, whether the therapeutical results of radium are sufficiently satisfactory to justify the expenditure of large sums of money in creating an apparatus that will produce x rays of the same wave length as that of radium, must be in the negative. For it seems to me that even if an agent was found which was capable of completely destroying every atom of the primary growth we should be no nearer to a cure than were the Egyptians in 2000 B.C. The reason is contained in question four in which Dr Scott says, "Metastases do all the killing." This unfortunately is only too true and but little progress will be made in cancer research unless this obvious fact is taken into consideration. It would seem that the presence of a primary lesion only indicates that the patient is cancerous—analogous to the primary chancre in syphilis. The removal or destruction of the chancre alone, however complete and satisfactory does not prevent the formation of a gumma at a later stage.

Dr Scott asks why the word metastasis is but seldom mentioned in discussions on cancer, and the recent meeting

of the British Empire Cancer Campaign was no exception. I think the answer must be because there is no known means of prevention. If this is so surely we are not justified in talking about a cure for cancer. Research workers might concentrate some of their energy on the solving of this problem. If, eventually, some means of preventing the formation of metastases is discovered, it is quite probable that the primary lesion will look after itself. If the principle of deep x-ray therapy is as stated in the second question, then clearly it can be of no real value in prophylactic work. It is rather like putting down an intense barrage here and there, not having the remotest idea where the enemy is hidden. Cut off their food supply or poison their water, their position and strength will then be of little consequence.

Question three deals with the value of pre-operative irradiation. Obviously if post-operative methods of irradiation are really reliable, pre-operative irradiation must be the correct procedure. Question five asks whether there is any evidence that secondary deposits are less likely to occur after the destruction of the growth by radium or x rays than after removal by operation. That is an important point, but I do not know the answer.

Finally, there can surely be no doubt of the palliative value of judicious doses of radium and x rays in cancer. I can also deplore the tragic results of well-meaning efforts to cure cancer by irradiation in unsuitable cases. The medical man's motto should not be forgotten. *Primum non nocere*—I am, etc.,

London W 1, May 5

Intraperitoneal Haemorrhage from a Graafian Follicle

Sir,—Dr Cresswell Davis has seen fit to state (*Journal* April 24 p 889) that of the two cases of ovarian haemorrhage which I reported only the second had its origin in a ruptured lutein cyst. If he had read my letter (*Journal* March 6 p 527) he could not have failed to notice that in both cases there was histological evidence that this was the source of the bleeding. His artless assertion that 'most of these cases appear to be of haemorrhage from a Graafian follicle' receives no support from his own case, in which no tissue was taken for 'section'—I am, etc.,

Birmingham, May 6

J C LEEDHAM GREEN

Water Dropwort Poisoning

Sir,—On Easter Monday, while visiting in the country, I knocked at a cottage door to inquire my way, and was confronted with a rather anxious mother holding a small girl who was having a convulsion.

I put the child on a sofa and she had five convulsions in rapid succession, becoming blue in the face, frothy at the mouth and with shallow respiration. Her elder sister was sent to fetch my bag from the car and she came back and said "Mother Vivian is on his back in the garden having fits." Now I had two children who were vomiting and having convulsions the cause of which was obscure and by this time I too was becoming anxious as the boy aged 5½ was unconscious, grey in the face and with his pulse imperceptible at the wrist. In view of his grave condition I injected 1 c.c. of coramine and later he showed signs of reviving. Both children seemed to have got over the serious effects next day, but their muscles were still twitching.

I discovered that both children had eaten the leaves and root of a plant they found in the river bed, the *Oenanthe crocata* or water dropwort, an exceedingly com-

non plant in this district Cushnys *Pharmacology and Therapeutics* gives a good description of the human poisoning which the symptoms of the children closely followed The poisonous principle is oenanthotoxin, which produces symptoms similar to those caused by picrotoxin In view of the coincidence and unusual nature of the cases I think them worth recording—I am etc,

Prevention of Constipation

SIR—Dr E M Dimock's article on the prevention of constipation by bran (*Journal* May 1, p 906) causes me to point out what may not be generally known in these motoring days, that it is customary for horses on dry food during the hunting season to have a bran mash every Saturday night—I am, etc.,

Rotherham May 3

G E MOULD

Technique of Ionization

SIR,—In his review (*Journal*, May 1, p 919) of Dr A R Hollender's *Physical Therapeutic Methods in Otolaryngology* your contributor may convey a wrong impression when he says, with reference to the ionization treatment of vasomotor rhinitis, that 'it is emphasized that benefit is obtained at the expense of permanent destruction of the ciliated epithelium of the nose, and this is clearly demonstrated in a series of photomicrographs' May I point out

1 That the technique of ionization described by Dr Hollender (pp 73-175) involves the passage of a current of 15 mA for ten minutes to one side of the nose at a time As I pointed out in my book *Hay Fever* (Oxford University Press) a current density of this order will produce diffuse destruction and fibrosis whereas a current of 3 mA to both sides of the nose simultaneously with proper attention to the technique of packing will not.

2 That the photomicrograph of the control in Dr Hollender's book shows cilia in some areas and absent in others" and that it is not in my opinion, a representative picture of an established vasomotor rhinitis since the stroma is slightly infiltrated by small and large lymphocytes and a few plasma cells and the mucous glands have a normal appearance The tissue is not oedematous and eosinophil cells are not present

3 That numerous workers among others Hansel Coates and Ersner and Weille have shown that cell metaplasia occurs in true vasomotor rhinitis before any treatment by ionization and that one of the most characteristic features of allergic nasal mucosa is the appearance of stratified squamous epithelium in place of the columnar ciliated type My own (published) histological observations confirm this Now stratified epithelium will not grow cilia and it is therefore absurd to condemn ionization because cilia are not found in sections taken afterwards

Furthermore, since the casual reader is likely to be misled by your reviewer's summary of Dr Hollender's experience with ionization in vasomotor rhinitis I must point out that Dr Hollender states the enthusiasm with which ionization has been pursued as a remedy for seasonal hay fever seems thoroughly justified For my part however I cannot agree that the American technique which involves the use of excessive currents is the best method of applying this treatment—I am etc

CLIVE SHIELDS

London W 1 April 30

* The Reviewer writes The position of ionization for vasomotor rhinitis must be very precarious if it is unable to endure the mildest criticism Dr Shields resorts to the ancient sophistry of violently rebutting a charge which has not been made Ionization has been condemned neither by Dr Hollender nor by your reviewer

Birching of Children

SIR—It is easy to agree with the general conclusion of your leading article on the whipping of child delinquents but difficult to subscribe to the extravagant statements of some of your correspondents For instance, it is asserted by one that all who advocate the whipping of children are actuated by sadistic impulses One is left with an uncomfortable feeling that a very large number of parents, teachers, and others in charge of children a generation ago probably a majority of the nation, were sadists judged by this criterion Further, what is a poor remedy in general may be excellent on occasion While no one would advocate corporal punishment as suitable for all children or all delinquencies, years of close study of school children have forced on me the fact that some boys can be taught and benefited by such punishment, while many cannot

Most of us will agree that to birch a little boy of 8 is, if not barbarous certainly futile But six strokes to a healthy boy of 14 is not a terribly severe ordeal and there exist many who would think it an efficacious way of dealing with some delinquents of 14 to 18 years Lastly, apart from the victim, there is little doubt of its success as a deterrent to others The child who is put on probation too often regards it as having been 'let off' and comes back to his fellows to boast that he has been 'down to the court and has come back scathless The knowledge that such punishment was even occasionally employed by the children's court would keep many a child from its first delinquency

Magistrates have full power of inquiry and a wide discretion and the fact that out of many thousands of cases in the juvenile courts in 1935 only 200 were ordered a whipping proves that their discretion has not been abused—I am, etc,

Hastings May 8

E C DOWNER.

"What is Osteopathy?"

SIR—In the *Journal* of April-24 Sir Walter Langdon Brown states that it must be difficult for me 'to try to be a modernist and a fundamentalist at the same time' The fundamental which is under discussion is that normal function is dependent on structural integrity no more no less I maintain I think with justification, that it is easier to be in this respect a fundamentalist and yet a modernist than it was, say, thirty years ago It is still easier now than ten years ago and it is easier this year than last

Sir Morton Smart states "To maintain a tissue in a healthy state regular normal fulfilment of the functions of the arterial, venous and lymphatic circulations is essential and this is even more so when a tissue has been injured Much fun has been poked by Drs Hill and Clegg at the statement of Snell's that the rule of the artery is supreme but is the above mentioned statement so far removed from the following definition of osteopathy?

Osteopathy is a manual method of healing It is based on the fact that abnormalities in the human framework ultimately cause disease by interfering with the blood and nerve supply to the various tissues and organs of the body Further by obstructing the vessels which carry away waste products these abnormalities allow other factors in ill health to exert their influence unduly

Surely it is easier to substantiate that dictum now than it was when Langdon Brown brought out the first edition of *Physiological Principles in Treatment* I have compared the recent most excellent seventh edition of this unique work with the earliest edition in my possession the third The comparison is interesting and I would recommend those who are concerned with this argument to do the same

It may be of interest to your readers to know what the reactions are in osteopathic circles to the book *What is Osteopathy?* by two junior officials of the British Medical Association. This book will be answered in no uncertain terms and perhaps it would have been wiser if the Association had rested content with its recent legislative victory. It must be stated at once that no charge of deliberate unfairness can be brought against the authors. The book is written for the public, whose sense of fair play it would be unwise to offend. Yet one gathers the impression that the passages from the report of the Select Committee of the House of Lords, appointed to consider the Registration and Regulation of Osteopaths Bill are selected not to show what osteopathy is but to indicate the limitations of that system of practice.

H G Wells's preface is inconsistent and valueless. Is there anything in such books as *First Men in the Moon* and *Food of the Gods* that would indicate that the opinion of their author is of any more value than the readers'? It is certainly of less value than mine. It might be thought that such a visionary as H G Wells would be found arguing on the side of the osteopaths. We would rather have him where he is for all his excursions into science and in fantasies of seeming actualities. Yet his natural inclinations would have led him to support the osteopaths had he not so controlled the natural sentiments which he confesses to own. On the one hand he states that osteopathy considered "as anything more than the manipulative side of surgery is impudent balderdash," and on the other hand, he issues a warning to medical men and urges the medical profession "to take into itself as speedily as possible whatever good there is in manipulative healing. Few would argue that manipulative surgery is as comprehensive as manipulative healing. Osteopaths are manipulative healers and there is nothing in manipulative surgery that they do not use when the occasion arises. George Bernard Shaw's attitude is indicated in a typical Shavianism. 'No osteopath wants to be a doctor, but every doctor should be an osteopath.' Shall we leave it at that and call it all square?

Fifty pages of the book are given over to the ridicule of Still. He laid himself open to it. None of us belittle the discovery by Harvey of the circulation of the blood because some of his other works were not up to the standard of that epoch making discovery. Though Harvey left no immature compositions and, as it has been said, no juvenalia over which we may smile indulgently, nevertheless he did learn from Fabricius, as he leant over the railing in the windowless amphitheatre at Padua, that the renal valves are always directed toward the heart.

The most misleading chapter in the whole book is the chapter on "Osteopathic Education in America." It is either deliberately misleading or inexcusably out of date. The osteopathic profession is young, the first college being opened in 1892. To get a comparable stage in the development of medical education one would have to go back to the days before the passing of the Medical Act of 1858. The regular course for graduation as Doctor of Osteopathy in any one of the six colleges approved by the American Osteopathic Association consists of four years of nine months each. No reference is made to the fact that the College of Osteopathic Physicians and Surgeons, Los Angeles and the Philadelphia College of Osteopathy require two years of medical work in an approved college before beginning the osteopathic course. One would not gather from this book that there are at present ten thousand fully qualified practising osteopaths and that in the United States there is one osteopath to every twenty doctors of medicine and one per 17,000 of

the population. There is no word of the fact that there are more than two thousand students at present enrolled in the six approved American colleges.

The slogan of the book seems to be 'Get your name on to the Medical Register.' Such, at any rate, is the advice given to the British osteopath in search of State registration. It may be that the medical opposition in this country is so strong that that is the only practical course open, it may be that the general public would so wish it. Be that as it may, the qualified osteopaths in this country have already taken steps to carry out all the recommendations of the Select Committee of the House of Lords.

There are seven members of the British Osteopathic Association whose names appear on the Medical Register. The question might be asked. Why did Dr Hill or Dr Clegg not approach one of these gentlemen. Had they done so they would have been able to give a truer answer to the question, 'What is osteopathy?'

Yet there is a glimmer of hope, for the final sentence of the book is 'If it is found that osteopathic manipulation has something which medical manipulation has not, then this something else will have to be included in the therapeutic equipment of the practitioner of medicine. The warning of Wells has been taken to heart—I am, etc,

Edinburgh April 30

W KELMAN MACDONALD

* In the preface to their book, *What is Osteopathy?* Dr Hill and Dr Clegg state 'We would point out that the views expressed in this book are our own, and not necessarily those of the Association to which we belong,'—Ed. B.M.J.

Research in Mental Hospitals

SIR,—As an assistant medical officer in the L.C.C. Mental Hospital Service, may I endorse the letter headed 'Research in Mental Hospitals' (*Journal*, May 1, p. 942) by emphasizing the present understaffing in these hospitals. The average A.M.O. has over 500 patients of all types under his care, and it is not surprising that many doctors who enter the service with considerable enthusiasm and interest find that after a year of routine physical and mental examination and treatment of ordinary medical and surgical diseases they no longer have the time or inclination to carry out individual and psychological treatment of their patients. It has been said that the mental hospital doctor does little work and should have plenty of time to treat his patients. If he attempts to do this properly the magnitude of his task so appals him that he gives up his ideal of psychological treatment—providing he has had this ideal—and contents himself with the minimum of routine work, mental and physical notes, and records of casualties, etc.

Asylums in the past cared for their patients, but hardly thought of actively trying to improve their mental condition. Now it is realized that a great deal can be done by individual psychotherapeutic measures, but these take time. May I indicate the problem with reference to my own work. I have 500 patients in my wards, new admissions come in a slow but steady stream to replace those who die or are discharged. If I did no routine or administrative work, but confined myself to psychotherapy for fifty hours a week I could give each of my patients less than a minute a day!

Never has psychiatry presented so many obvious fields for research as at the present time. Research workers are needed and should be encouraged but until the number of patients under the care of each medical officer has been considerably reduced little treatment and no research can be usefully undertaken—I am, etc

A.M.O.

Obituary

H P FAIRLIE MD

Anaesthetist Western Infirmary and Royal Hospital for Sick Children Glasgow

We regret to record the death of Dr Harry Prescott Fairlie, the well known Glasgow anaesthetist. He studied medicine at the University of Glasgow and the London Hospital, and graduated MB Ch B Glas in 1905, proceeding to the MD., with commendation, in 1912. Dr Fairlie was honorary secretary of the Section of Anaesthetics at the Annual Meeting of the British Medical Association in Glasgow in 1922, vice president of the same Section at Manchester in 1929, and president at Eastbourne in 1931. He was also president of the Section of Anaesthetics of the Royal Society of Medicine in 1903-4, and at the time of his death was still a member of the council of the Association of Anaesthetists and of the editorial board of the *British Journal of Anaesthesia*. He wrote many papers on his specialty and collaborated with Dr J S Ross of Liverpool in the well-known *Handbook of Anaesthetics* which reached its third edition in 1929.

We are indebted to the Editors of the *Glasgow Medical Journal* for permission to print the following extracts from an appreciation by Professor Samuel J Cameron.

By the death of Harry Fairlie the medical profession in the West of Scotland lost one of its most distinguished members. Although his death was not unexpected it was regretted by all who knew him for it is granted to few to be the subject of such universal respect. My association with Fairlie covered a long period as I first met him when I was a demonstrator of anatomy in the University of Glasgow in the year 1902. Fairlie was a member of the class and I was attracted to the youth by his eagerness to acquire knowledge and by his modest demeanour, characteristics which persisted throughout his professional career. The friendship formed then continued to the end of his life, and during that time I have never heard Fairlie make an ungenerous remark. It may not be generally known that his professional life might have been passed elsewhere for soon after he started practice he was strongly tempted to apply for an anaesthetist's post at Dundee. When he consulted me I urged him to remain in Glasgow, as work would inevitably come with the years. This forecast proved accurate, for there came a time when his engagements were so numerous that one had to arrange operations for certain days if his services were to be secured. It is superfluous to refer to his skill as an anaesthetist; his ability was recognized by all who had the privilege to work with him. He was ever alert to test any innovation in his specialty and he possessed an unerring instinct for quickly assessing the value of new methods. During the thirty odd years I was associated with him he had only one anaesthetic death in my practice. This occurred when he had many years' experience in the administration of anaesthetics but such was the natural modesty of the man that the event not only gave him great distress but caused him to consider if he was adequately equipped for the specialty which he practised. It did not seem to impress him that so many members of his profession requisitioned his services for themselves or members of their families nor was he the least elated when he was elected president of the Anaesthetic Section of the Royal Society of Medicine. For some years he was anaesthetist

of the Royal Infirmary, but later he joined the staff of the Western Infirmary with which hospital he was associated until his death. He contributed many valuable articles to the literature of anaesthesia, and he reissued Stuart Ross's textbook on the same subject.

Apart from his profession he had many interests. Classical music gave him great pleasure, and so he regularly attended the concerts of the Scottish Orchestra. Whenever he could secure a few hours of freedom he would motor into the country so that he might enjoy a walk among the hills. He was greatly interested in bird life; he seldom returned from a fishing expedition (another favourite pastime) without having made observations relating to the arrival or behaviour of some of his feathered friends. A memory of Fairlie would be incomplete without a reference to the circumstance that his actions were governed by profound religious convictions. Throughout a long and painful illness his faith sustained him. Never did he question his lot, his sole concern being for the welfare of his family, to whom he was devoted.

To all who came in contact with Fairlie he will be remembered not merely as a perfect anaesthetist but as a quiet and heroic little figure who adorned his profession by the sterling qualities of his character.

S J C

BENNETT MAY, CBE, FRCS

Consulting Surgeon, Queen's Hospital Birmingham

Emeritus Professor Bennett May, who died on May 3, was the senior member of the medical profession in Birmingham and was in his time one of the leaders in surgery in the Midland counties. Bennett May was born ninety two years ago at Farnham in Surrey, and entered the Sydenham College School of Medicine in Birmingham in 1864. Sydenham College being the medical school attached to the Birmingham General Hospital. He became a Fellow of the Royal College of Surgeons of England in 1876, and was appointed resident surgical officer at the General Hospital. For a time after that he was assistant to Oliver Pemberton in his private practice. In 1880 he was appointed casualty surgeon at the Queen's Hospital and in 1881 became honorary surgeon there. He resigned his active association with the hospital in 1906 when he was appointed consulting surgeon. From 1887 to 1909 May was professor of surgery in the Birmingham Medical School. For many years he had been an active member of the British Medical Association having served on the council of the old Birmingham and Midland Counties Branch of which he was president in 1899 and on the Birmingham Branch Council. At the Annual Meeting in Belfast in 1884 he was secretary of the Section of Surgery and was a vice president of the same section at Birmingham in 1890.

Bennett May practised surgery before the advent of the extreme specialism which we find to-day. His interest in surgery was wide and his work was the engrossing factor in his life. If one were asked to say what were the characteristics of May as a surgeon one would answer that they were his diagnostic ability, his extreme care and his meticulous accuracy. As a teacher May was not impressive; he thought aloud too much but as a surgeon to intelligent students May was supreme. He taught by the excellence of his methods rather than by word of mouth. During his period of active work at the Queen's Hospital he had as his colleague that very exceptional man Jordan Lloyd. To the writer it was always interesting to watch the work of these two men who were so different in their methods and in their personal characteristics.

Lloyd—brilliant, original, swift in making his diagnosis and swift in operating, Bennett May—not what one would call original or brilliant, but extraordinarily thorough, painstaking, and careful. These two men by such different paths attained the same object—namely, results in their work, the excellence of which in that day could not be surpassed.

To strike a more personal note, May was a man much beloved by all those who knew him well. He was kind and generous, he had no malice, he spared no pains to help the young man who had surgical ambitions. He had many foibles and peculiarities absolutely clean and careful in his surgery, yet he never would admit that sepsis was due to organisms. He decried the usefulness of all such aids as the microscope and clinical chemistry, but the results which May obtained would stand investigation in any epoch. They showed what a man of character and ability could do without extraneous help. The force of May's language when he was expressing his opinions on people or on surgery often made his hearers smile, but never lessened their affection and respect for a very remarkable man.

The later years of Bennett May's life were clouded by illness, and his colleagues saw little of him. He was, in a way, a man of the past, but his death reminds us of the work of one who advanced surgery and who set an example in his efforts to attain excellence in his work that has been an inspiring force to all of us who were privileged to watch his surgical practice.

L G

The death of Dr JAMES CARRUTHERS occurred unexpectedly on April 29 at his residence, Hawthornlea, Uddington. Born at Newarthill over 65 years ago and educated at St John's School Hamilton he entered Glasgow University in the late eighties, and after graduating M.A. and M.B. Ch.B. embarked on a career in general practice. After a voyage as a ship surgeon to Rangoon he became assistant at Kilsyth and later for five years at Bothwell, where he gained an extensive experience of general practice under the late Dr William Grant Macpherson. In 1904 he entered into partnership with Dr Thomson of Uddington and his life's work has been associated with that district. Dr Carruthers was for many years public assistance medical officer and was a justice of the peace for the county of Lanark. His extensive practice did not permit him to take a large share in public affairs. He was deeply interested in general literature and was the proud possessor of many first editions. He was very conscientious and painstaking in his work and was deservedly held in high regard by the community which he had faithfully served for almost forty years. The interment took place on May 1 and was attended by a large and representative company. He is survived by his widow and two daughters.

The death occurred at a nursing home on May 4 of WALTER FLIGH MACKINNON, GOLDIE OBE FRCS, medical officer of health for Leamington Spa. Goldie was born at Simla on June 6 1879 was educated at Charterhouse and intended like his brother, for the Army, he passed for Sandhurst but defective eyesight prevented his following that profession. He then proceeded to the University of Edinburgh and afterwards to St Mary's Hospital. He qualified MRCS, LRCP in 1903, obtaining the FRCS(Eng) in 1906 and the DPH in 1910. After various clinical appointments in London at St Mary's Hospital Great Ormond Street Hospital, and Mount Vernon Goldie joined the Colonial Service and was in East Africa for three years. Severe malaria prevented his return for a further period of duty and he applied for and was appointed assistant medical officer of health and tuberculosis officer for the city of Norwich. On the outbreak of war he joined the Navy, and

continued in the Service till 1919. Practically all this time was spent at sea, and he received the O.B.E. (military). My first meeting with Goldie (writes H G W) was on his appointment as medical officer of health and school medical officer for Leamington Spa in 1920, and the friendship formed then has, I am glad to say, continued and increased during the years which have since elapsed. Professionally Goldie was a man of wide experience and ripe judgement, and his powers of observation were the envy of many of us. His long experience in the diagnosis of infectious disease was always at the disposal of colleagues, and his conclusions were expressed with a decisiveness, not to say forcefulness, which was characteristic of him. Beneath a somewhat reserved manner he had a great liking and understanding of young people and children especially seemed to discover this at once. To see his manner of dealing with them at his hospital or infant welfare centre was a revelation of kindness and understanding. In the untimely death of Goldie Leamington Spa has lost a devoted servant, medicine a worthy exponent, and his friends one-whom it will be impossible to replace.

Universities and Colleges

UNIVERSITY OF OXFORD

The Board of the Faculty of Medicine has elected the Hon. Mrs M A Jennings, M.A. B.M. of Lady Margaret Hall to the Schorstein Research Fellowship.

UNIVERSITY OF CAMBRIDGE

The Board of Research Studies has approved C. C. Okell M.A. M.B. Chir. for the degree of Doctor of Science.

The title of the degree of M.B. was conferred during the month of April upon G M Brown, C J Ormerod and E L Willis of Girton College.

UNIVERSITY OF LONDON

At a meeting of the University Court held on May 5 with the chairman (Lord Macmillan) presiding, two generous gifts to incorporated colleges were gratefully accepted—namely, two thousand £1 preference shares in the firm of Messrs H A Lewis and Co given to University College by Mr H L Jackson governing director of the firm and valuable scientific equipment for research presented to Kings College by the Halley Stewart Trust.

ROYAL COLLEGE OF PHYSICIANS OF LONDON

Dr Edwin Bramwell will deliver the Croonian Lectures on Clinical Reflections upon Muscles Movements and the Motor Path at the College Pall Mall East S.W., at 5 pm on May 25 and 27 and June 1.

At the meeting of the College held on April 29 licences to practise were granted to the following candidates:

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH

At a quarterly meeting of the College held on May 4 with the President Dr W T Ritchie in the chair Dr Douglas James Campbell (Grimshy) was introduced and took his seat as a Fellow of the College and Dr George Abeysinhe Weera Wickramasuriya (Ceylon) was elected a Fellow of the College The Freeland Barbour Fellowship was awarded to Mr Walter Tebrich B.Sc.

The Services

DIRECTOR OF MEDICAL SERVICES IN INDIA

The War Office announces that with the approval of the Government of India Major-General G C. Tabureau D.S.O., late R A F C Deputy Director of Medical Services Northern Command York, has been selected to succeed Major General E. A Walker C.B., I.M.S. as Director of Medical Services in India as from August 10 when the latter vacates the appointment

Medical Notes in Parliament

The House of Lords on May 5 received the Livestock Industry Bill from the House of Commons and read it a first time A first reading was also given to the South East Essex Joint Hospital District Bill On the same day further amendments were made in the Children and Young Persons (Scotland) Bill and the Maternity Services (Scotland) Bill was read a third time The latter with the Special Areas Amendment Act the Earsdon Joint Hospital District Act and the South Nottinghamshire Joint Hospital District Act, received the Royal Assent on May 6

The House of Commons is due to reassemble on May 24 and will that day discuss the Civil List The text of the Finance Bill is expected to be issued about that date There will be no change in the Cabinet during the recess

On May 4 the Livestock Industry Bill and the Diseases of Fish Bill were each read a third time the latter had also passed the House of Lords The Widows, Orphans, and Old Age Contributory Pensions (Voluntary Contributors) Bill passed through the report stage in the House on May 6 and was read a third time

Sir Francis Fremantle presided on May 5 at a meeting of the Conservative Health and Housing Committee, when Dr C F McCleary spoke on the menace of depopulation in the British Empire He showed that it had been established by Kuckynski's method of computation that if present conditions continued the death rate in the United Kingdom would exceed the birth rate within the next five years The same danger existed in Australia and New Zealand Dr McCleary urged that the public should be warned on this subject before the economic and social consequences became serious

Factories Bill in Committee

Clause 77 (Power to suspend certain provisions of Part VI—employment of women and young persons—in emergency) was discussed when the Standing Committee of the House of Commons resumed consideration of the Factories Bill on May 4 The clause was approved with the additional provision moved by Sir JOHN SIMON to ensure that the exemption should not conflict with an international convention restricting the employment of women or young persons in factories. On Clause 78 (Exceptions as to male young persons employed in shifts) Sir JOHN SIMON said the subject matter of the clause was difficult and was directed to industries which required to be carried on day and night He had come to the conclusion that it would not be right to make any exceptions at all as regards young persons under 16 although the Committee might have to do it in the case of youths between 16 and 18 He would amend the clause so that it should apply to young persons who had attained the age of 16 He had also put down other amendments Sir Ernest Graham Little had proposed an amendment to ensure that where young persons were to be worked in shifts in exceptional circumstances or in lat hours they should only so work when it was ascertained that they were physically fit for it his proposal was that there should be a preliminary medical examination Sir John Simon doubted whether it was good to put a young man who believed himself to be perfectly fit through that kind of trial beforehand He would prefer to insert in the clause a provision similar to one in Clause 92 enacting that the young person who had attained the age of 16 and was working at night should not remain in that employment after the expiration of such period as might be prescribed unless he had been examined by the examining surgeon and certified to be fit for that employment He would also add a provision by which there was to be a periodic examination it was not enough to be sure that the youth was fit at the beginning only Mr

SHORT said that the amendments were an improvement and could tend to relieve the pressure of discussion.

Sir JOHN SIMON'S amendment omitting young persons under 16 was agreed to but one from Mr. SHORT the effect of which would be to prohibit the employment of young persons on the shift system between 6 a.m. and 10 p.m. on Sundays was negatived. Other amendments moved by Sir JOHN SIMON were accepted, including the following:

A young person who is taken into employment in accordance with the foregoing provisions of this section in any factory shall not continue to be so employed after the expiration of such period not being less than seven days as may be prescribed by the Secretary of State unless he has in accordance with these regulations been examined by the examining surgeon and certified by him to be fit for such employment, and the regulations shall provide for the re-examination of young persons so employed at intervals not exceeding six months.

MEDICAL OPINION ON NIGHT WORK

On the motion that the clause stand part of the Bill Mr. DENMAN said it was clear there was no chance of abolishing at this stage night work for young persons. Medical evidence to show that night work was injurious to young persons was lacking but strain in early years injuriously affected them later on as adults. He had statements to that effect from a doctor at a London hospital who had experience of the night work referred to in this clause and from a factory inspector, who said that although no evidence could be brought of ill health among young persons the result could be seen in adults. An authoritative statement in the *Lancet* published after the second reading of the Bill argued that it was biologically unsound to subject young persons between 16 and 18 to the strain of night work and that there was less danger in allowing young girls to do it than in allowing youths of the same age to do it.

Sir ERNEST GRAHAM LITTLE said he would re-enforce the protest against working young persons at night by figures from a book just published by Dr. VERNON an experienced research worker whose conclusions had been accepted by the whole medical profession. He showed an extraordinarily high mortality rate in the age group of males between 15 and 19. His unit in this age group was 40,000 and the fatal accidents constituted one fifth of the deaths in that group. The departmental committee on the employment of young persons recently recommended a general prohibition of night employment for young persons for a period of eleven hours, including the hours of 10 p.m. to 6 a.m. Dr. VERNON said that on the whole accidents were more frequent during night work and in the iron and steel industry fatalities were sometimes 50 per cent higher.

The clause as amended was added to the Bill by 24 to 13.

Clause 79 (Exceptions as to simultaneous hours for meals and rest) and Clause 80 (Exceptions as to employment during intervals) were added to the Bill. Clause 81 (Exceptions as to use of rooms during intervals) was added to the Bill with an amendment. Clause 82 (Exceptions as to continuous employment of male young persons employed with men) Clause 83 (Exceptions as to male young persons employed on repairing work) and subsequent clauses to Clause 92 were added to the Bill.

MEDICAL EXAMINATION TO DETERMINE FITNESS

On Clause 92 (Certificate of fitness for employment of young persons) Sir ERNEST GRAHAM LITTLE had a series of amendments. He said all were attested by medical authorities. Sir JOHN SIMON said Sir ERNEST would bring within the clause girls up to 18 and leave it as it was in the case of boys up to 16. The clause required that every young person entering a factory under the age of 16 should be examined by the examining surgeon who would re-examine if there was any doubt as to fitness for employment. If the young person moved to another factory during the first two years there would be a further examination. Responsible medical authorities connected with the factory system advised him that these examinations were sufficient to secure that any young person under 16 who suffered from defects would be warned off that

employment. There was to be a liaison between the examining surgeon and the school medical officer, and in doubtful cases the examining surgeon would be able to obtain information from the latter. His medical advisers were satisfied there would be considerable feeling among older juveniles if it was said that if they chose to come into factory life they would by law be put under compulsory medical examination at intervals. The healthy young men of 17 did not regard themselves as children and the Committee would have to consider what was involved in legislating for female young persons if they had to be exposed to a compulsory examination by an examining surgeon. Sir ERNEST GRAHAM LITTLE said the objections indicated by the Home Secretary had not arisen in factories, and there had been no difficulty between the whole-time medical officers of large firms and the general practitioners in charge of factory workers outside. On the contrary the work had been harmonious. Remarkable improvement had resulted in the health of the workers from periodical and close examination by a full-time medical officer. He withdrew his amendment and the clause was added to the Bill.

When the Committee resumed on May 5 the clauses dealing with ships, docks, works of building, and engineering construction were added to the Bill. Mr. GIBBINS withdrew an amendment applying Clause 99 (Ships) to men engaged in disinfection of a ship. Mr. GEOFFREY LLOYD said the point was better covered by the Bill then before the House of Lords which dealt with hydrogen cyanide fumigation. Mr. GIBBINS said that men searching ships for rats which were the causes of plague should be included. Clause 102 (Employment of women and young persons in places other than factories in processes connected with lead manufacture or involving the use of lead compounds) was added to the Bill without debate.

FACTORY INSPECTORS

After discussion of administrative matters on subsequent clauses the Committee considered Clause 115 (Appointment and duties of inspectors and clerks and servants). Mr. ALFRED SHORT said the Committee would like to know the number of factory inspectors at the moment and the number of new factory inspectors who might be appointed in the future. The Memorandum issued with the Bill estimated that the increased cost would be in the neighbourhood of £25,000 to £30,000. He would also like to know the qualifications of inspectors and whether competent and practical men and women would be appointed as distinct from merely university trained people. These inspectors should be relieved from a mass of clerical work. They ought not to be employed in tabulating masses of figures and statistics when their job should be outside, in and around the factories examining the conditions, seeing for themselves that the provisions of the Act were properly and efficiently carried out and looking after the welfare of the people concerned. He would like to know the position of female inspectors and what was to be their number.

Mr. GEOFFREY LLOYD said the question of pay and other questions which had been raised were settled by the Treasury and the conditions laid down by the Civil Service Commissioners on general principles applicable to the whole of the Civil Service. Women factory inspectors were about 30 per cent. of the inspectorate, which corresponded roughly to the proportion of women in industry. They were treated from the point of view of seniority in the same way as men and in the Home Office there was a common seniority list. There was nothing technically to bar a woman becoming Chief Inspector of Factories. There were also two women superintending inspectors of factories. The financial resolution attached to the Bill would provide for thirty to forty more inspectors, but the amendments made in Committee might affect that number. The clause and the subsequent clauses dealing with the powers and certificates of inspectors were approved.

DUTIES OF EXAMINING SURGEONS

On Clause 119 (Appointment and duties of examining surgeons) Major NEVEN SPENCE moved to leave out a proviso the effect of which he said was to allow the Secretary of State to authorize a medical practitioner employed by the occupier of a factory in connexion with medical supervision to

act as an examining surgeon. Factory examining surgeons were specialists in regard to knowledge, experience and qualifications and ought to be whole-time men at the job. A medical practitioner in charge of welfare work in a factory had not necessarily any of the qualifications which he should have as an examining surgeon. If under Clause 67 the Home Secretary required an investigation and report in the case of death or injury due to exposure to fumes or in the case of any disease that should not be carried out by a paid employee of the occupier of the factory.

Mr GRAHAM WHITE and Mr RHYS DAVIES supported the amendment but Sir JOHN HASLAM said the factory inspector became a specialist in his own business in knowing the law and understanding adolescence. It was a wise move indeed for those progressive firms who had set an example to the whole of the country in looking after the health and welfare of their workers to call in the factory surgeon as their medical adviser not only in regard to certifying, but in every other aspect of their line. It was a slur on these medical men that they should be excluded by statute from occupying this position and the Home Office would be ill advised to exclude them from carrying on welfare work in the factories in addition to their ordinary certifying business.

Mr LLOYD said that when he first saw this provision he inclined to take the view that it was not right to put any man in a position in which there might be a conflict of duties or interests. Since then he had heard the other side of the question and it impressed him. This was only an authorization to enable the Home Secretary to allow this procedure in certain cases and for certain purposes and therefore it could be closely controlled by the Home Office. Most of these works doctors were keen on their job. In relatively progressive industries the employers had been sufficiently public spirited to go to the trouble and expense of having a special doctor for this purpose. That was a development that the Home Office would like to encourage. It did seem that it was not necessarily right always to forbid a works doctor, who knew so much about the conditions in the factory from performing some work under the Bill such as for instance the certification of the fitness of young persons. People might take a different view but under the safeguards provided in the Bill the Home Secretary might authorize this. If it were authorized improperly it might be liable to abuse but on balance it was wise to keep it in.

Mr SHORT suggested that the Home Secretary should insert words by which while it would be possible for a paid medical officer of a particular factory to be an examining surgeon he would not be permitted to investigate the cause of death or of some disease reported by the inspector which occurred in his own factory but some other examining surgeon would be called in to do that class of work. Sir JOHN SIMON said he liked the suggestion. He would be prepared to see the proviso run something after this fashion:

Provided the Secretary of State may authorize a medical practitioner to act as examining surgeon for that factory and instead of saying for such purposes as the Secretary of State may direct it might be sufficient to say "for the purpose of examining and certifying the fitness of young persons."

Major NEVEN SPENCE withdrew his amendment and that proposed by Sir John Simon was made.

On receiving from Mr Lloyd a promise that the subject would be considered at a later stage Mr RHYS DAVIES withdrew an amendment proposing that subject to the consent of the employed person concerned the examining surgeon shall have the right to inspect the medical records of the medical practitioner employed by the occupier of the factory.

SCHOOL MEDICAL HISTORIES

On the motion that Clause 119 stand part of the Bill Mr FLEMING SMITH said progressive education authorities were of opinion that the medical officers who administered the Education Acts ought to have jurisdiction also over the children until they reached the age of 18. These medical officers were already responsible for children up to the age of 16 in the

elementary schools and in the case of the secondary schools responsible for them until the age of 18. He asked the Home Secretary before the report stage to reconsider the whole of this clause in order that this developing scientific method of handling children up to the age of 16 might be continued until 18 years of age. Factory inspectors were fully occupied with their duties arising out of the Factory Acts, without having to concern themselves with children up to the age of 18. This specialized subject ought to be handled by specialists, and there was growing up in the schools a specialized method of dealing with it. Under the Education Act 1936 it would be the duty of education authorities to give beneficial employment certificates and in giving those certificates the education authorities would have regard to the health and physique of the children. These records having been obtained they should be used for the benefit of the nation and of the children themselves and progressive education authorities should have the right to look after the children until they reached the age of 18.

Mr LLOYD said if it was necessary to change the provisions of the Bill to make sure these medical histories would be available and if they could not be made available in any other way the case would be strong but even then there would be objections. A large number of school children—he had heard it estimated at 50 per cent—went to work in areas different from those in which they had grown up as school children. That would make the working out of this scheme if based on the educational medical system difficult. In any case these medical histories could be made available. There were elaborate provisions in Subsection (9) of Clause 92 for this. These provisions brought in the Education Act, and also rules that might be made by the Ministry of Health for securing the observance of the provisions.

The clause as amended was approved.

On Clause 120 (Fees of examining surgeons) Mr VIVANT moved an amendment which would have the effect of charging the Home Office with the expenditure in connexion with the administration of this part of the Act. Mr LLOYD replied that these medical examinations were on a similar basis to other precautionary measures which occupiers were required to take and of which they had to bear the expense. He did not see any reason why they should be relieved of this particular expense. The Government did not wish to add to the burdens of the State in this matter and there had been no general body of representations in favour of this change which would seem to be unnecessary.

The amendment was withdrawn and the clause ordered to stand part of the Bill. Clauses dealing with offences and fines were also approved and the Committee adjourned till May 25. It is hoped that a further two sittings may complete the committee stage.

World Opium Convention

On May 3 Mr A. HENDERSON asked the Secretary of State for Foreign Affairs whether any action had been taken at Geneva to set up a preparatory commission in anticipation of the World Opium Conference to be held in 1940. Mr EDEN said that preparatory work for the Conference for Limiting the Production of the Opium Poppy and of Raw Opium was among the items on the agenda of the next session of the Opium Advisory Committee which would open at Geneva on May 24. The Committee would consider the appointment of a preparatory committee to draw up a preliminary draft convention. Mr HENDERSON asked the Foreign Secretary whether in view of the need for drastic and effective action against the opium evil the Government would instruct its delegates to work in co-operation with the delegates of the United States of America to ensure that this Conference should be a success.

Mr EDEN: Yes I can give an assurance. Our delegates will do everything in their power to co-operate with those of the United States.

Malnutrition Discussed in the House of Lords

Viscount ASTOR in the House of Lords on May 5 drew attention to the report of the Advisory Committee on Nutrition to the Ministry of Health. He asked whether the Ministry of

Labour inquiry for the purpose of the cost-of-living index would include an inquiry into dietary surveys, and if so how many families would be concerned and what steps were being taken to ascertain the family incomes so as to correlate this inquiry with that proposed to be undertaken by the Registrar-General and an independent statistician. He also asked for details of this inquiry by the Registrar-General and of any dietary surveys conducted by local authorities in urban and rural areas of England and Wales and in Scotland. Lord Astor said that the main cause of malnutrition was poverty. By malnutrition he meant a degree of ill health or of subnormality due to malnourishment and in other cases bad physical development due to malnutrition in early youth. The problem was one of purchasing power, and the report of the Advisory Committee on Nutrition substantiated this contention.

The problem arose largely because of malnourishment in youth. A number of cases of maternal mortality were due to malformed pelvis from malnutrition of the woman when she was a child. They had to get into their minds an entirely new standard. At the beginning of last century medical officers in the large industrial cities were satisfied with the housing conditions to-day medical officers walking down the same streets unanimously agreed that those houses must be pulled down as slums. The House must bear that in mind when they saw quoted reports from medical officers of health to the effect that there was no problem of malnutrition. Those who made such reports were out of date and not acquainted with the new findings of science. Making all allowances for overstatements one could say that a real problem of malnutrition affected millions of people in this country. The questions he had asked the Government were based on recommendations of the Advisory Committee and in particular he wished to refer to page 26 of the report where reference was made to methods of clinical assessment. Did the Minister contemplate an investigation of the clinical aspects in direct correlation with the dietary surveys which he proposed to make? Other countries—Scandinavia and the United States of America—made surveys on a large scale. In America they made 700,000 family budget inquiries. A great opportunity would be missed if the Government did not insist that these surveys were adequate.

GOVERNMENT'S MILK POLICY CRITICIZED

The Advisory Committee's report indicated the importance of milk as an article of consumption in diet. Yet after four years of the Milk Marketing Scheme there was a low consumption of milk and retail prices were the second highest in the world. Dairy farmers were all discontented. There must be something fundamentally wrong with a scheme that had such results. The Milk Board had built up new industries of butter making, cheese making, and processed milk by imposing a tax of roughly 3d a gallon on this account. The Minister of Health as soon as the report of the Advisory Committee was published had circularized all local authorities drawing their attention to the recommendations of the committee and urging them to make more provision for supplying milk to mothers and children. Why should the Minister of Health ask ratepayers to spend money on buying milk which had been artificially put up in price?

The Minister of Health recently mentioned the provision made for giving the unemployed in a certain area milk at 2d a pint. Everybody ought to be able to get milk at 2d a pint without subsidy. Instead of 3d., which was the present cost. It was quite possible to do this. He would not say that an immediate drop of a penny in the price of milk was followed by an immediate rise in consumption but a considerable increase would follow over a long period. One of the difficulties was that many children got a taste for tea before they went to school and did not avail themselves of the cheap milk provided because their palates had become vitiated. Much could be done in persuading parents not to cultivate tea-drinking among very young children. The cost of milk affected not merely the lowest wage-earners but the "black-coated" section of the community and the hospitals. There was no reason why the nation should not control the wholesale distribution of milk. Last winter, when there was a

shortage of milk for liquid consumption it was going under contract to factories. There must be something wrong there. Even after the cost of milk had been reduced the Government would still have to subsidize milk for certain of the poorer sections of the community.

If details of income and standards of living of workers given in a book just published by Mr. Seebohm Rowntree were accurate as he had every reason to believe they were tens of thousands of children of to-day were being malnourished. Mr. Rowntree suggested some system of family allowances to ensure that where the number of children exceeded three a sum of 5s per child should be given but Lord Astor thought it would be better to help in kind. He did not advocate free meals for all children, but thought Parliament must contemplate subsidizing food and should not limit this to children of school age. If they were to spend five million pounds in subsidizing food supplies at maternity centres, nursery schools, and elementary schools they would at no distant date have a strong and happy race and a far more prosperous agriculture. The health foods were the perishable vegetables, fruits, and milk, and they should subsidize the consumption of these.

Lord SNELL supported Lord Astor, and said that when he spoke of malnutrition he did not suggest acute starvation but a deficiency in kind and in the quality of food that was necessary to give a balanced diet and vigorous health. Lord ELYSLEY defended the Milk Marketing Board and said it had saved 135,000 milk producers in the country from disaster. Lord NOEL-BUXTON stated that adequate nutrition could sometimes cure a severe case of impaired physique even when hospital treatment had failed. The BISHOP OF NORWICH said he was not sure that certain restrictions put upon the quality of milk were as necessary as the doctors said. He had never seen anything convincing on the relative value of plain milk, pasteurized milk and boiled milk. Lord DENMAN said milk in this country cost twice what it cost in Belgium and Holland nearly twice as much as it did in France and was much higher in price here than it was in Germany. Milk was sent to London and the other great cities and the agricultural worker was unable to pay the high price for his family. He hoped the Government would not give way to the pressure brought to bear upon it to make it impose tariffs on butter, cheese, and other milk products.

GOVERNMENT'S REPLY INVESTIGATIONS IN PROGRESS

Viscount GAGE replying for the Government said the average consumption per head of most foodstuffs had increased since before the war and with one exception there had been a general improvement in the quality of the national diet. The supply of energy giving foods available for the nation was more than the League of Nations considered adequate. Private investigators had attempted to show how the food was distributed according to various occupations, wages and incomes. The report of Sir John Orr was a document of considerable value and other reports were also available but the Government accepted the recommendation of the Advisory Committee on Nutrition that more information was desirable and was prepared to collect it.

People were willing to explain their outgoings and their budget but were very unwilling accurately to disclose their incomes. Incomes, therefore had to be estimated and related to the budget in a roundabout way. For the Ministry of Labour inquiry in connexion with the cost-of-living index figure it was hoped to procure weekly budgets of 10,000 families taken over four separate weeks in various parts of England, Wales and Scotland. To find the number of calories, vitamins, carbohydrates, and so forth that were consumed they proposed a quantitative dietary survey of a much more detailed character. This was already in progress and would eventually embrace 500 families, of which 200 would come from Scotland. A qualified investigator had to spend much time in the homes of these families weighing up all the food which came into the house and what was left over and estimating its composition down to the constituents of the puddings, and noting any wastage. He referred Lord Astor to the survey at Newcastle-on-Tyne affecting sixty nine

families the results of which had been published. The results of another inquiry affecting 205 families in the West Riding would probably be published by the end of this year. Inquiry had begun in the Isle of Ely, Surrey, Glossop, Aberdeen and certain industrial towns near Glasgow. It would be extended to Somerset, Glamorgan, Carmarthen, Cardigan, Aberdeen, County Banff, Kincardine, Dumfries and the Border Counties. Statistics would be compared with information in the possession of the Ministry of Labour on wages rates current in the occupations concerned.

Turning to the controversial question of how nutrition could be improved, Viscount Gage admitted that three-quarters of the problem turned on the capacity of people to buy the right food and therefore food must be cheap. During the Government's period in office the number of persons in employment had increased by about two millions whereas the price of essential foodstuffs had remained fairly steady during the last five years. The price of milk had not varied much since 1931. In 1931 the price per quart was 6d and in 1937 it was 6½d. In what had been called the health foods prices had been fairly steady. The Government had been active in ensuring a supply of milk on special terms to special classes of the community principally school children, expectant mothers, infants and unemployed in the distressed areas. The scheme for cheap milk was now helping 2,500,000 school children. Over 400,000 children received free milk last year, and 143,000 children received free meals. Last year about 7,000,000 gallons of milk were distributed free or at less than cost price according to the means of the applicant. The Government would press forward all these schemes to the best of its ability. There might be an improvement in the number of mothers attending ante-natal clinics although about 50 per cent of them attended now. Before the publication of the Government's conclusions on the Milk Reorganization Report upon which much depended he could not announce any new and remarkable extension of Government policy.

The Capitation Fee Court of Inquiry

In an answer on May 6 to Mr Rhys Davies, Sir KINGSLEY WOOD said that, put briefly, the object of the tribunal to inquire into the fees paid to panel doctors under the national health insurance scheme was to investigate whether any and if so what alteration ought to be made in the amount of the doctors' capitation fee having regard to any changes since 1924 in the cost of living, the working expenses of practice, the number and nature of services rendered to insured patients and other relevant factors. This Court of Inquiry had been appointed by Dr Elliot and himself. The services of the following as members of the Court had been secured: Lord Amulree (chairman), Mr Thomas Howorth and Mr D. H. Robertson. The terms of reference were set out in last week's *Supplement* (p. 272).

Answering Mr Will Thorne, Sir KINGSLEY WOOD said this appointment of a court was to be regarded as a friendly arrangement to have this matter dealt with by independent people. There were discussions upon it between the British Medical Association and himself and it was considered that this would be the best means of dealing with the matter.

Mr THORNE: Are we to take it for granted that if the committee puts up a recommendation similar to the Government's offer to the doctors that recommendation will be put into operation?

Committee on Corporal Punishment

Sir JOHN SIMON announced on May 6 that he had secured the services of the Hon. Edward Cadogan as chairman of the committee to examine the various provisions of the law authorizing corporal punishment for both adult and juvenile offenders. The committee would take account of the different considerations affecting different aspects of the problem. He hoped shortly to announce the names of the remaining members of the committee.

Cleanliness of Public Telephones—Answering on April 28 questions by Colonel GOODMAN about the cleansing of mouth

pieces in public telephone boxes, Sir WALTER WOMERSLEY said the mouthpieces and earpieces of telephones in call offices provided with an attendant were wiped with a clean cloth moistened with suitable disinfectant every morning. At other call offices the frequency depended on the location of the kiosk and the extent to which it was used. A full investigation had been made into this question by a committee on which medical men sat, and their decision was that the infection was more psychological than actual.

Post mortem Examinations for Inquests—Replying, on April 29, to Mr Cecil Wilson, Sir JOHN SIMON said that by Section 24 of the Coroners (Amendment) Act 1926 a coroner might for the purpose of a post mortem examination, order that the body be removed to any place which may be provided for the purpose either within his jurisdiction or within an adjoining coroner's jurisdiction, but he might not under that section order the removal to any place other than a place within his jurisdiction provided by a sanitary authority or nuisance authority except with the consent of the person or authority by whom the place was provided. Sir John promised to make any investigation which he could of cases in which Mr Wilson thought that the circumstances of examinations should be brought to his notice.

Cost of Health Services for Children—Sir KINGSLEY WOOD stated on April 29 that in the financial year 1935-6 the latest for which figures were available grants paid by the Board of Education to local education authorities and voluntary institutions in respect of health services for school children amounted to £2706,342. In addition the Exchequer grant towards the cost of the scheme for supplying milk at half price to school children amounted to £397,184 for the year ended September 30th 1936. Corresponding figures were not available in respect of health services for young children not yet at attendance at school.

Vaccination and Small-pox Statistics—On April 29 Sir KINGSLEY WOOD furnished the following statistics:

England and Wales			
	Number of Vaccinations expressed as a percentage of total births	Small-pox cases notified	Small-pox deaths registered
1926	44.8	10,146	18
1927	44.9	14,767	47
1928	42.6	12,420	53
1929	39.9	10,968	39
1930	40.1	11,839	28
1931	39.0	5,664	9
1932	38.2	2,039	3
1933	37.0	631	2
1934	36.1	179	6
1935	*	1	0

* Figures not yet available

Approved Societies Transfer of Members—On May 3 Mr RHYS DAVIES asked the Minister of Health whether in view of the statutory title of members of approved societies to freedom of choice of society and right to transfer he would cause inquiry to be made whether there was in existence any written or implied agreements between large approved societies or groups of such societies where such statutory freedom was restricted. Sir KINGSLEY WOOD said that few societies had agreed not to accept applications for transfer from members of certain other societies but since under the National Health Insurance Act an approved society was free to reject an application for membership on any ground other than age such an agreement did not contravene any provision of the Act.

Local Government Superannuation—In the House of Commons on May 4 Sir KINGSLEY WOOD introduced the Local Government Superannuation Bill. The measure makes further and better provision with respect to the payment of superannuation allowances and gratuities by local authorities and certain statutory undertakers and with respect to the persons entitled to participate in the benefits of a local authority's superannuation fund or scheme.

Experiments on Animals—On May 4 Mr LEACH asked the Home Secretary how many inoculations had been performed in contravention of the Cruelty to Animals Act, 1876 by the experimenter referred to in the Home Office Return of Experiments on Living Animals for 1935 and what period of time had been covered by the illegal inoculations. Mr LLOYD replied: Fourteen and all were given on the same day.

Typhoid Fever in Liverpool—On May 4 Sir KINGSLEY WOOD told Mr Groves that 123 cases of typhoid fever (including paratyphoid) had been notified in Liverpool during the present year up to April 24 the majority of which occurred in an outbreak of paratyphoid fever in January. That outbreak was regarded by the local authority as now at an end.

Voluntary Hospital Finance—Mr SORENSON on May 6 asked the Minister of Health whether in view of the report of the Voluntary Hospitals Commission and of the increasing contributions by public authorities to voluntary hospitals he would require that the finances of voluntary hospitals should be pooled and that greater co-ordination should be effected between voluntary and public hospitals. Sir KINGSLEY WOOD answered that he had noted with interest that the Voluntary Hospitals Commission while not recommending the immediate pooling of hospital finances suggested the creation of regional funds. He had no powers in this matter which was one for consideration by the governing bodies of the hospitals. He would continue to encourage co-operation between voluntary and public hospitals which was already increasing steadily.

Sir Kingsley Wood further said it would not be a fair assumption to say the time had come when State aid should be given to all hospitals.

Bomb proof Shelters—Replying on May 6 to Lord Castle reagh Mr GORTON LLOYD said it would not be practicable on grounds of cost to construct on any appreciable scale shelters proof against a direct hit by a large high-explosive bomb. Arrangements were being made with the help of local authorities for suitable places to be marked as refuges for those who might be caught in the street, and for such places to be given as good protection against blast and splinters and gas as possible. A handbook for householders on air raid precautions was in an advanced state of preparation.

Water Supply Investigation in Scotland—Answering Sir Archibald Sinclair on May 6 Mr ELLIOT said an investigation into domestic water supplies in Scotland was now being undertaken by the Department of Health for Scotland. Information provided by local authorities was now being considered with a view to securing as complete a survey as possible of actual and potential sources of supply and estimating the present and future requirements of the various localities. The investigation would show how the sources of supply could be used so as to secure a satisfactory system of distribution. The Department's engineers were also engaged on estimates of probable costs of water and drainage schemes for "landward areas." The special problem of the sparsely populated areas in the Highlands and Islands was under consideration in the light of the report of the Committee on Scottish Health Services.

Notes in Brief

In 1934 there were two cases of corporal punishment for prison offences; none in 1935 and six in 1936.

The number of deaths of infants under 1 year classified to vaccination or other causes of vaccination which were recorded by the Registrar General during the ten years 1926 to 1935 was forty-two.

A Departmental Committee has been set up in Tanganyika in many other parts of the Colonial Empire to study questions relating to human nutrition. The desirability of combining medical and anthropological inquiries will be given full weight by the committee.

Sir John Simon has consulted the Lord Chancellor on the question of amending the Infanticide Act of 1922 to define the type of child born. Examination of the problem showed a number of difficulties in amending the existing Act, and Sir John told the House of Commons on April 15 that he could not propose any legislation on this subject.

Medical News

The seventh John Mallet Purser Lecture will be delivered by Professor E. D. Adrian M.D., F.R.S., at Trinity College, Dublin, on Wednesday next, May 19, at 5 p.m., in the Department of Physiology (Medical School). His subject is "The Physiology of Sleep."

At a meeting of the Court on April 13 the Governors of Guy's Hospital decided, on the recommendation of the Medical Committee, that the ward previously called "Lazarus" should now be named Keats Ward, to commemorate the association of John Keats with the hospital.

A meeting of the Medico-Legal Society will be held at 26, Portland Place, W., on Thursday, May 27, at 8.30 p.m., when a paper will be read by Dr Alexander Baldie on "The Prevention and Treatment of Delinquency."

The next quarterly meeting of the Royal Medico-Psychological Association will be held at the Leicester-shire and Rutland Mental Hospital, Narborough near Leicester, on Friday, May 21, at 2.30 p.m., under the presidency of Dr M. Abdy Collins.

A meeting of the Society of Radiotherapists will be held at 11, Chandos Street, W., on Friday, May 21, at 5 p.m., when there will be a discussion on "Malignant Tumours of the Testis," to be opened by Drs Gordon Taylor, J. H. D. Webster Burrows, Payne, and Phillips.

The second congress for allergic diseases will be held at Düsseldorf on May 22 and 23 with Professor Otto of Frankfurt as president of honour and Professor Haag of Düsseldorf as president. The secretary is Dr Karrenberg, Fischengasse 45, Düsseldorf.

The second congress of the International Society of Gastro-enterology will take place in Paris from September 13 to 15 inclusive, during the Universal Exhibition and will be followed by the International Congress on Liver Insufficiency at Vichy from September 16 to 18. At the earlier of these the two subjects for discussion are the early diagnosis of cancer of the stomach and intestinal obstruction. The first will include clinical and serological diagnosis, gastroscopy, chemical tests, pathological anatomy and histology, and operative diagnosis. The second will be considered from the medical, surgical, pathological and radiological aspects and Sir David Wilkie is one of the openers. At Vichy the discussions will be medical and therapeutic, and deal with such topics as hepatic oedema, the malarial liver, hepatic enlargement in childhood, sulphur metabolism, surgical intervention, and specific medication. Dr A. F. Hurst is president of the British committee and Sir Walter Langdon Brown is a president of the congress on hepatic insufficiency. Special travel and accommodation facilities are available for British visitors, and full details of these and the programmes may be obtained from Dr T. C. Hunt, 49, Wimpole Street, W.1.

The second All-Indian Congress on Gynaecology and Obstetrics will be held at Bombay about Christmas time, when the chief topics for discussion will be the toxæmias of pregnancy and cancer of the cervix.

King Edward's Hospital Fund for London on May 7 received a special Coronation gift of £1,000 from an anonymous donor. No special appeal is being made on this occasion, but it is interesting to recall that when King Edward VII was crowned in 1902 over £100,000 was received by the King's Fund in Coronation gifts.

The April issue of the *Bulletin of Hygiene* contains a comprehensive review of recent work on drug addiction, by Dr E. W. Adams of the Ministry of Health.

The Lord President of the Council has appointed Professor W. L. Bragg, F.R.S., who now holds the Langworthy Chair of Physics in the University of Manchester, to be Director of the National Physical Laboratory.

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR BRITISH MEDICAL JOURNAL B.M.A. HOUSE TAVISTOCK SQUARE W.C.1

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication.

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager British Medical Association House Tavistock Square W.C.1 on receipt of proofs. Authors over seas should indicate on MSS if reprints are required as proofs are not sent abroad.

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager.

THE TELEPHONE NUMBER of the British Medical Association and the *British Medical Journal* is EUSTON 2111.

THE TELEGRAPHIC ADDRESSES are
EDITOR OF THE BRITISH MEDICAL JOURNAL *Atiology*
Westcent London

FINANCIAL SECRETARY AND BUSINESS MANAGER
(Advertisements, etc.) *Articulate Westcent* London

MEDICAL SECRETARY *Meduseca Westcent* London

The address of the B.M.A. Scottish Office is 7 Drumsheugh Gardens Edinburgh (telegrams *Associate Edinburgh* telephone 24361 Edinburgh) and of the Office of the Irish Free State Medical Union (I.M.A. and B.M.A.) 18 Kildare Street Dublin (telegrams *Bacillus Dublin* telephone 62550 Dublin).

QUERIES AND ANSWERS

Iodine in Pulmonary Tuberculosis

Dr JAMES PIRIE (Ashton House Harbury Leamington Spa) writes: Some years ago in Germany I was shown a method of treating tuberculosis by intensive nascent iodine sometimes used alone at other times in conjunction with tuberculin and contratoxin serum No. 4. I have employed this method ever since generally with very good and in some instances brilliant results. In order to check the progress made a count was taken of the polymorpho neutrophil nuclei. I shall be pleased to send any doctor details of how the treatment can be carried out.

Income Tax

Ground Rent and Property Tax Depreciation

S. L. is allowed to deduct one third of the rental value rates etc. of his house—Can he also deduct one third of the ground rent and property tax? He is allowed wear and tear only in respect of his car—Is that correct?

* The rental value deduction is in substitution for the "rent" deduction where rent is in fact paid. Ground rent and property tax would be included in the actual rent and no additional deduction can be allowed for those payments. Wear and tear is allowable only in respect of plant and machinery. Such minor necessities as surgical instruments are dealt with by the allowance of the cost of replacement as and when incurred but "wear and tear" is sometimes allowed in respect of major items of professional equipment such as x-ray apparatus or other electrical appliances.

Liability for Temporary Residence

SOJOURN arrived in this country for a temporary purpose in August 1935 but owing to a change of plans has become a resident here.

* He is liable to assessment as for the financial year ending April 5 1936 *et sequitur* as a British resident. (This would have been the case as regards income arising in or remitted to this country even if he had not changed his mind seeing that he spent six months of that year in the United Kingdom.) He is therefore liable (a) in respect of any earnings here and (b) in respect of income arising abroad as from the date of coming to this country. He is entitled to the usual married man's allowance (£180) the children's allowance (£60 × 3 = £180) for 1936-7—the amounts for 1935-6 are slightly larger—and to "relief" in respect of Dominion income tax. In all the circumstances "Sojourn" would probably be well advised to call at the office of the inspector of taxes explaining his circumstances, and complete the necessary forms of declaration.

LETTERS, NOTES, ETC.

Rheumatism and Tuberculosis in General Practice

Dr G. L. BUNTING (Crowborough) writes: In spite of the comprehensive surveys which from time to time appear in the medical journals on the subject of chronic diseases the general practitioner is still faced with the problem of treating these conditions in his practice. I have in mind two widespread diseases—rheumatism and tuberculosis—and with some trepidation venture to make the following suggestions. The special treatments such as baths light heat and electrical therapy for rheumatism with pneumothorax and sanatorium treatment for tuberculosis are of course the province of the large institutions. The bulk of cases cannot be treated in this way and therefore remain under the care of their own doctors. Vaccine and tuberculin treatments have been tried with disappointing results. Judging from the results obtained at the Charterhouse Rheumatism Clinic in the borough in recent years the reasons for previous failure seem obvious. The new and somewhat revolutionary system of dosage as taught by Warren Crowe points clearly to a sensitivity to much smaller doses than those formerly employed. The relief of pain and benefit to health which follow the employment of the new technique have to be seen to be believed. I was able to use it extensively in my last years of general practice with most gratifying results. Impatience and a refusal to discard all previous ideas of dosage are often to blame for apparent failures. The only sane way to test this is to visit the clinic with an open mind and be convinced or remain sceptical. During many years of practice I have never lost my faith in tuberculin and though reluctant to admit it there is I fancy an increasing number of sanatorium experts who make use of it. If confidence is established by success in the rheumatic field I venture to prophesy that the day is coming when tuberculin will also come into its own.

Sweet Chestnuts in Epidemic Jaundice

Dr E. A. ADDISON (Ipswich) writes: I practise in an agricultural district and I was for some years puzzled as to the cause of an epidemic jaundice occurring every autumn among the children attending the village school until I definitely traced the cause to eating chestnuts. I refer to the small sweet English chestnut of which there is an abundance in a neighbouring park. The children are fond of them and usually eat them uncooked and freshly gathered. I have also known the parents to suffer from jaundice after eating the chestnuts brought home by their children. I have never read that chestnuts were a cause of jaundice, presumably this sort of chestnut differs from imported chestnuts which have been some time in transit.

The Old English Inn

Miss M. L. SPACKMAN (Clitheroe) writes with reference to Dr A. A. Warden's letter in the *Journal* of April 3 (p. 732). According to De Quincey inns towards the end of the eighteenth century were extremely dirty and both he and Charles Moritz a German pastor who visited this country in 1782, found that pedestrians were greeted with "scowls" but Moritz discovered that some innkeepers could be conciliated by drinking with them. People who travelled in post-chaises were well received. De Quincey said that in the early nineteenth century matters had improved but we may be sure if the modern tourist could go back in time and visit them he would miss safe drinking water the works of the plumber and the present-day standard of cleanliness.

A Warning

Dr A. SCOTT (Pittingham near Wolverhampton) informs us that on May 4 he encountered and was responsible for having removed from his district a man who has been imposing on the medical and dental professions in the Midlands for some months past and may now transfer his activities to some other area. He purports to be either a dental surgeon or an old medical student who failed in his finals many years ago and has since acted as dispenser. He usually gives his university as Edinburgh and tells a typical hard luck story in the hope of eliciting alms. His description is age about 40 height about 5 ft 6 in hair partially bald sandy turning grey eyes blue arcus senilis present features large rubicund nose luxuriant sandy moustache turning grey respectably dressed talks quietly with a slight (real or assumed) Scottish accent.

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

378

Hydatid Disease

J KNEEBONE (*Med J Austral* February 6, 1937, p 201) describes sixty cases of hydatid disease in adults, and H B GRAHAM (*ibid*, p 206) seventy four in children. Both authors agree that the incidence of the disease in the State of Victoria is decreasing owing to propaganda, regulations pertaining to slaughtering and to the sale of meat, and better surgical facilities. In Kneebone's adult cases thirty-one had cysts in the liver and nine had cysts in the lung. Graham found only twelve cases of simple liver cyst in children under 7½, in whom multiple liver cysts, pulmonary cysts and cysts both in the liver and in the lung were more prevalent. Both authors agree that daughter cysts are less common in children than in adults and that they occur less often in the lung because of rupture than in the liver. The chief complications of hydatid cysts are rupture and sepsis. Kneebone noted fourteen cases of rupture in liver cysts and seven in pulmonary cysts, and four cases of sepsis following rupture of liver cysts. Graham states that rupture and sepsis frequently occur in children and he believes that rupture of the cyst precedes and causes the infection. Hydatid infantilism was a complication in one case. Of diagnostic methods the x rays are of greatest importance in the detection of pulmonary cysts. Kneebone used Casoni's test in twenty nine cases with twenty two positive results and Graham found it of value. The complement fixation test was used in five of Kneebone's cases with two positive results. Graham found that sera failed to fix the smallest amount of complement only when little or no leakage of antigen had occurred from cyst to host. After operative intervention, rupture or onset of infection the test was positive to a varying extent for many months but in the absence of further cysts negative reports were ultimately obtained. The general prognosis is good. Kneebone had six deaths from hydatid disease. Graham states that hepatic and pulmonary cysts have a good prognosis, especially in children over four years. Cysts in the brain (which are more common in children than in adults) accounted for three and cysts in the spine and kidney for two of Graham's ten fatal cases.

379

Recklinghausen's Disease

Y. HIRAGA (*Jap J Derm Urol* January 1937, p 1) describes his findings in twelve cases of Recklinghausen's disease. Only one case showed the cardinal symptoms of skin and nerve tumours and large and small pigmented patches. One case occurred in a girl of 13. In two cases there were anomalies of hair and bone and in eight the condition was found in other members of the family. In eight cases the skin was thickened and abnormally elastic in those parts affected by pigmentation and tumour formation. The most common changes in the cerebrospinal fluid were an abnormal globulin reaction, protein increase and usually lymphocytosis. The fluid pressure was almost always raised. In four cases Hiraga obtained an encephalogram one of which was normal but in the remainder there was evidence of enlargement of the ventricles and the subarachnoid space. Nine cases in which the ear was examined all showed some abnormality. In six cases in which the vegetative nervous system was examined no aetiological relation between it and the disease could be demonstrated. Hiraga found sudanophil cells which are the phagocytes derived from the tumour cells in eight cases. He irradiated the spine in two cases with the hope of affecting the skin tumours but without any beneficial result. Hiraga believes Recklinghausen's disease to be a hereditary anomaly in the same sense as a naevus.

380

Malignant Diphtheria

H KNAUER (*Med Klinik* February 26, 1937, p 289) does not agree that the occurrence of malignant diphtheria can be explained wholly on the grounds of different strains of bacilli with varying virulence. A mild and a severe diphtheria may result from the same source in two individuals. The diphtheria bacilli themselves can change their pathogenicity and toxicity during the course of the disease. It has been shown that in malignant diphtheria the bacilli produce more toxin than those in milder forms of the disease. In view of the fact that in a certain proportion of cases of clinically malignant diphtheria no diphtheria bacilli can be found in the early stages, but that in a third streptococci can be cultured from the blood, and that antitoxin is valueless in treatment, the author concludes that a symbiosis is responsible. He describes a typical case of malignant diphtheria which came under his care primarily with aphthous stomatitis. Diphtheria bacilli were never found, but on the third day streptococci could be cultured. Knauer advocates that in all cases of malignant diphtheria specific antitoxic therapy should be combined with the administration of anti-streptococcal serum and neosalvarsan. He has found the latter to be a potent bactericide for diphtheria bacilli and other organisms.

Surgery

381 Tumours and Ulcers of the Palate and Fauces

WALTER HOWARTH (*J Laring* January, 1937, p 1) describes a great variety of tumours and inflammatory lesions of the palate seen in the course of twenty-five years. The most common tumours in the substance of the palate are the 'mixed tumours'. They have a close resemblance to the mixed parotid tumours and probably arise from embryonic remnants. The embryology of this region is very complicated, and no part of the body suffers more than the palate from arrest and perversion of development. Mixed tumours are no longer classified as endotheliomata. They arise from fully developed glandular tissue, and are therefore epithelial in origin. Mixed tumours are comparatively benign in character, but if their capsule should be ruptured through trauma, or if an incomplete operation is performed, they may undergo malignant changes. Haemangioma and haemangio-fibroma are rare tumours of the palate. The diathermic knife is particularly valuable for the excision of these vascular tumours. Fatty tumours in the palate are extremely rare, and the author has only seen one case. Osteomata are occasionally described. A hard, oval, bony swelling under the mucosa of the hard palate in the mid-line is really an anatomical peculiarity called 'torus palatinus', and is not neoplastic in origin. Epitheliomata of the palate and fauces often begin in the tonsil and spread upwards into the palate or downwards into the base of the tongue. The author favours excision with the diathermy knife and block dissection of the glands of the neck. The end results of sixty one cases were as follows: 36 per cent died within the first year of operation, 39.5 per cent died between one year and five years, 24.5 per cent lived more than five years. Among the ulcerations Mr Howarth describes 'pre-cancerous epitheliomatosis' which he believes is a definite clinical entity. The shallow ulcers with raised whitish plaques yield readily to light diathermic cauterization but the lesions reappear after an interval of sometimes as long as three years. Ultimately the condition becomes malignant. The histological picture resembles certain forms of dermatosis with chronic atypical epithelial proliferation.

382 Acute Osteomyelitis of the Spine

A CHINAGLIA (*Arch ital Chir*, vol 44 p 517) describes a case of acute osteomyelitis of the first two cervical vertebrae in a young man aged 18 a fortnight after discharge from hospital following a month's treatment of suprahyoid abscesses of dental origin. Death occurred eight days later from bulbo pontine meningitis four days after a retropharyngeal abscess (containing *Staphylococcus pyogenes aureus* in pure culture) had been opened from the mouth. A full account is appended of the 266 well authenticated cases in the literature. It would appear that acute osteomyelitis of the spine is commonest in the second decennium affects males chiefly and is most often due to *Staphylococcus pyogenes aureus*. The lumbar spine is most commonly affected the disease usually attacks only one vertebra, and the arch rather than the body. Radiology appears to have given very little diagnostic help. Operative treatment is justified in all regions of the spine, and is especially indicated when the body, as distinct from the arch is affected results are worse in the cervical and thoracic than in the lumbar zone. The mortality of collected cases has been 46 per cent.

383 Traumatic Nephritis

D CIDDIO (*Policlinico Sez. Chir.*, March 15, p 121) states that contusions of the kidney are not frequent, as is shown by the fact that Gérard in 1930 could find only sixty five cases of renal trauma among 136,246 surgical lesions. The existence of traumatic nephritis has indeed been denied by many writers, in the case of both the affected kidney and its fellow. As the subject is not only of surgical but also of medico-legal interest as regards the question of estimating incapacity resulting from such lesions Ciddio carried out experiments on rabbits with the following results. In fifteen animals subcutaneous contusion of one kidney did not produce any lesions in its fellow but in one case in which suppuration had taken place in the contused kidney degenerative lesions in the convoluted tubules were found in the opposite kidney. The lesions, however, were not comparable to those found in Bright's disease.

Therapeutics

384 Ambulant Treatment of Lupus Vulgaris

G HOPF (*Z. Tuberk.* 1937 Bd 77 Heft 4, p 269) states that there is no ideal treatment of lupus vulgaris. Each case has to be considered individually. The ambulant method is contraindicated in cases of widespread and rapidly increasing lupus. Foci which can be treated surgically must be removed in hospital, but in lupus of the face a better cosmetic result is obtained with conservative treatment. Dietetic treatment is of the utmost importance. The author recommends a rigid modified Gerson diet which is rich in mineral salts and avoids a harmful over dosage of sodium. The poorer the diet is in protein the more certain is the effect on the inflammatory process. Ultra-violet light therapy is valuable when combined with dietetic treatment. Local tuberculin administration may also be of value. The author's ambulant treatment is as follows: A salt free diet rich in vitamins is instituted and potassium, calcium and magnesium salts are added. General ultra-violet ray treatment and cod liver oil improve the patient's general condition. After three to six weeks dietetic treatment local irradiation is begun and repeated every week. In chronic cases local tuberculin treatment is instituted at once but in acute cases it is contraindicated. Ektebin ointment is massaged into the nodules for two to five days. The local reaction is treated on subsequent days with moist fomentations. On its disappearance one to three further courses of irradiation are given at weekly intervals. Of forty six patients

treated on these lines the majority were cured or the condition greatly improved. The disadvantages of ambulant treatment are that it takes a long time, that the diet is often irksome and that ultra-violet therapy is costly.

385 Liver Extract in Pemphigus Vulgaris

W. BADE (*Derin Wschr.* March 27, 1937, p 389) states that in spite of a vast amount of research the aetiology of pemphigus vulgaris is still obscure. The number of recommended treatments of the condition has only proved that pemphigus may or may not be cured with different therapeutic measures. The author is of the opinion that pemphigus is due to some form of toxin, but he is not prepared to say whether it is derived from metabolic disturbances or from secondary sources which originally have nothing to do with the pemphigus. It is known, however, that detoxication occurs through the liver, and the healthier the liver the sooner will the condition clear up. Bade assumed in two cases that the liver was at fault, and sought to raise its detoxicating function by administering liver extract. Both patients were completely cured and have remained free from the condition, in one case for nine months in the other for six months. In both cases liver was given by intramuscular injections every other day for three to four weeks.

386 Improved Specific Anti streptococcal Sera

M. GUNDEL, J. WÜSTENBERG and W. HEINE (*Klin. Wschr.*, March 20, 1937, p 417) distinguish six types of haemolytic streptococci. Their differentiation is not difficult, and is described in detail. They each produce a specific pathological condition which can be influenced only by the administration of a specific serum corresponding to the particular strain of streptococcus. This fact explains the frequent failures of the usual stock anti streptococcal sera. Improved results could only be achieved if in every streptococcal infection the specific strain was established and the appropriate serum given.

Anaesthesia

387 Ephedrine in Spinal Anaesthesia

M. L. SALKOW (*Anaesth. and Analges.* January-February, 1937, p 51) discusses circulatory collapse with falling blood pressure during spinal anaesthesia and considers that it is due to vasomotor dilatation both in the anaesthetized segments and in the rest of the body. Ephedrine is commonly given to combat this fall and acts by vasoconstriction in the splanchnic and somatic areas by increasing the rate and strength of the heart beat and possibly by increasing the coronary flow. Unfortunately it also tends to cause or aggravate fibrillation. When given in the usual way—that is, hypodermically or intramuscularly in doses of 1/2 to 1½ grains—it is apt to be unsatisfactory and unreliable but its effect is striking and immediate when given intravenously. The author reports a series of seventy cases in which the blood pressure was controlled during operation by the continuous infusion into a vein of a dilute solution of ephedrine hydrochloride 1 grain in 100 or 200 ccm of normal saline. This was begun immediately after the spinal injection the initial rate of 100 to 120 drops a minute being maintained until the blood pressure showed signs of rising above normal. The rate was then reduced to that needed for the maintenance of pressure usually 40 to 50 drops a minute. Young persons and those with good heart muscle generally needed the more dilute solution and a slow rate of administration. The amount of solution mentioned was usually enough but if necessary half a grain of ephedrine in 100 ccm was added. In fifty one of the seventy cases there was no fall in blood pressure and only a slight drop in twelve. In only four cases was there a severe fall with the usual symptoms there were no deaths in

the series Auricular fibrillation, already present in two patients was increased by ephedrine, but the former rhythm was restored on its cessation in a third case fibrillation began during operation but caused no inconvenience and was followed by uneventful recovery. The general appearance of the patients in this series was much better than that usually seen with spinal anaesthesia, and there were no post operative headaches

388

Vinesthene

L. BRINGS (*Schmerz Narkose anaesth* February 1937 p 177) describes his experience with the new inhalation anaesthetic vinesthene in 119 cases. Vinesthene is a pure vinyl ester having the formula $\text{CH}_2=\text{CH}-\text{O}-\text{CH}_2-\text{CH}_3$. The anaesthetic was used without a mask, it was poured over several layers of gauze and inhaled. Sleep followed rapidly and the awakening was equally rapid when the gauze was removed. The quantity used varied between 10 and 30 c.c.m., and the length of the anaesthesia between two and ten minutes. The pulse, blood pressure and respiration remained unchanged throughout the anaesthesia. When small doses were given there was no vomiting at the awakening. There was no post operative sleep. In one case the anaesthesia was extended to thirty minutes without any ill effect. Owing to insufficient muscular relaxation the anaesthetic is not suitable for laparotomies.

389

Collapse During Spinal Anaesthesia

W. DIETER (*Schmerz Narkose anaesth* April 1937 p 1) has for long considered spinal anaesthesia the best method for gynaecological surgery except in Caesarean section or other operations in the later months of pregnancy since at that time the splanchnic pool of blood is already greatly augmented and further increase owing to vasomotor paralysis may lead to dangerous shortage of blood elsewhere. The chief drawbacks of the method are the frequency of post-operative headaches and of circulatory collapse and although pentocain L, which he has been using recently gives otherwise excellent results it has so often caused a more or less serious drop in blood pressure that he is now having the latter investigated before, during and after operation. In healthy persons he has commonly found a fall in systolic pressure of 20 to 40 mm Hg and of 40 to 60 mm Hg in less favourable cases. For prophylaxis and treatment he recommends eardiazol-ephedrine which acts both centrally and peripherally. He reports cases in which this was successfully given in doses of 1 c.c.m. intramuscularly twice daily for a few days before and after operation and upon the table at the beginning of operation or when indicated by a falling blood pressure. A case of sudden and severe circulatory collapse after an hours anaesthesia was successfully treated by immediate slow intravenous injection of 2 c.c.m. eardiazol-ephedrine.

390

Evipan Narcosis

G. VIDILI (*Nord med Tidskr* January 30 1937 p 161) has given evipan by intravenous injection in 1720 cases. His one certain and one possible evipan fatality were both at the beginning of his series when his knowledge of the dosage was still imperfect. Since February 1934 he has had no deaths. In a few cases however when the narcosis seemed too deep he has found it desirable to restore the patient quickly to consciousness by an intravenous injection of coramine. He finds evipan particularly suitable in those cases in which ether narcosis is more or less contraindicated by the condition of the respiratory tract. Evipan is also particularly useful for patients over the age of 45 (as many as seventy were over 70) for the debilitated and for sufferers from general infections or bronchitis. On the one hand some and robust patients are apt to be violent on regaining consciousness and to need two or three assistants to keep them in bed. This difficulty may

be overcome by repeated doses of morphine. After the age of 45 to 50 such excitation is increasingly rare, being practically unknown among elderly patients. The author has given from only a few c.c.m. up to 30 c.c.m., and he insists that it is as necessary to individualize and to avoid rule of thumb dosage with evipan as with ether. Indeed the range of sensitiveness of different patients to evipan is very wide and two patients of the same age, muscular development and weight may require very different doses. But if the anaesthetist individualizes strictly and is careful with his dosage, he can graduate his narcosis with practically the same nicety that he can with ether.

Obstetrics and Gynaecology

391

Colporrhaphy and Ventrofixation

E. TRIER MØRCH AND S. MULLER (*Hospitaltidende* February 23, 1937, p 219) have undertaken a follow up study of the seventy-five patients operated on for prolapse of the uterus in a Danish hospital between 1924 and 1933. The observation period ranged from two and a half to twelve years. The treatment consisted in most cases of colporrhaphy followed after a fortnight by fixation of the uterus to the anterior abdominal wall in such a way that should the uterus recede and part company with the abdominal wall a complete septum would still unite the two instead of a single band offering opportunities for intestinal obstruction. Both the vaginal and the abdominal operations were performed under spinal anaesthesia. The seventy-five patients were classified according to their age and the degree of their prolapse, only two were under 40, twenty were between 40 and 50 and the remainder were over this age. It was instructive that of the twelve patients who had died in the interval as many as ten had suffered from total prolapse although there were only twenty-four such cases. Among the sixty-three survivors there were only four whose uterus had again prolapsed in all the other cases these had become firmly adherent to the abdominal wall. There were however three cases of rectocele and one of cystocele. In the latter case in intermittent incontinence of urine and in two other cases frequency of micturition were noted. In as many as six cases ventral hernia was found. It was however, so slight in three cases that the patients had not detected it. The authors express surprise and disappointment over the number of these hernias, having hoped that the precautions taken to prevent them at the time of operation would have been more effective.

392

Lutein Cysts After Hydatidiform Mole

M.-A. WEIL (*Bull Soc Obstet Gynec Paris*, February, 1937, p 135) describes the case of a 5 para aged 22 who on the third day after the insertion of laminaria tents and extraction of a hydatidiform mole weighing 11 kg (after three months amenorrhoea) had a rigor and signs of acute peritonitis. Operation showed the abdomen to contain free streptococcal pus and two large lutein cysts of the ovaries one cyst twisted through 360 degrees on its pedicle being partially gangrenous and ruptured. Death followed in twelve hours. COUVELAIRE (*ibid* p 136) has seen a case of hydatidiform mole in which no adnexal abnormality could be detected when the patient left hospital six weeks later hysterectomy was performed for acute torsion of a lutein cyst. An untwisted lutein cyst was present on the other side and the uterus was seen to contain a small nodule of chorion epithelioma. There was no recurrence. L. GERNETZ (*ibid.*, p 150) describes the case of a 2 para aged 25 from whom a hydatidiform mole was extracted, the uterus after four months amenorrhoea had exceeded the size of a six months pregnancy. A small cyst (the size of an egg) palpated in the posterior fornix attained within a month the size of the uterus at term. Considerable anxiety was felt as to the possible presence of a chorion epithelioma, but operation

was rejected by reason of a diminishing titre of gonadotropic hormone in successive blood tests. Six months after the expulsion of the mole the cyst had disappeared and a final blood test gave a negative pregnancy reaction. Gernez states that while some two thirds of moles are associated with lutein cyst formation large cysts may exist with no chorion epithelioma and this may follow in the absence of cyst the biological tests constitute a safe guide in prognosis and after treatment.

393

Ergometrine

L. WIRTH (*Munch med Wschr* February 26 1937 p 324) reports fifteen months trial of ergobasine. Ergobasine is the name suggested by Stoll and Burckhardt for the water-soluble, small molecule ergot alkaloid isolated by Moir and Dudley (*Brit med J* 1935, 1 520) and called by them ergometrine and by others ergotocin or ergostetrine. Wirth used either a solution of ergobasine tartrate (containing 0.2 mg in 1 ccm for injection or 0.25 mg in 1 ccm for oral administration) or a mixture containing 0.125 mg ergobasine tartrate and 0.25 mg of gynergen (that is, ergotamine tartrate) in 1 ccm. He reports that these preparations act more quickly than others on the uterus during Caesarean section their effect on its contraction was notable within 10 to 20 seconds of intramural or intravenous injection. Given orally after labour (about 0.5 ccm ergobasine solution twice or three daily) they appeared to lessen the incidence of lochial stasis and subinvolution. They were satisfactory also in treatment of puerperal haemorrhages and in accelerating expulsion of the placenta. No toxic symptoms appear to have been noted.

Pathology

394

Erythrocytes in Acholic Jaundice

J. C. HAWKESLEY (*J Path Bact* November 1936 p 565) records investigations into the changes in the erythrocytes in eight cases of familial acholic jaundice both before and after splenectomy and blood transfusions. In one case at the age of 36 hours there was a reduction in mean diameter of the erythrocytes and increased fragility but a normal blood count and an absence of clinical signs of the disease. There is apparently therefore some erythropoietic abnormality at birth to which is added later the morbid influence of splenic overaction. In other cases blood transfusion temporarily raised the mean cell diameter. After splenectomy there was neither significant change in the mean cell volume nor statistical evidence of the presence of two populations of cells. The mean red-cell diameter however moved towards normal, but swung back later, and the ultimate Price Jones curve was of normal variability, microcytic in type but less so than before operation. These changes were not accompanied by fresh haemolytic activity, and demonstrate some persistence of abnormality. The disease is to be regarded as due neither entirely to a primary abnormality of erythropoiesis nor entirely to primary splenic over activity; there is a more complex interconnection of these two factors, which varies from case to case.

395

Pneumonias of Infancy

L. K. VIKTOROFF and his co-workers in Moscow (*Ann Inst Pasteur* March 1937 p 253) have isolated a pneumococcus from the sputum in 84 per cent. of cases of lobar pneumonia and 74 per cent. of cases of bronchopneumonia in a series of 350 children. The aetiological significance of the strain isolated was confirmed in those cases in which the blood pus and necropsy specimens were examined bacteriologically or the immunological reactions of the serum were tested in convalescents. Using Cooper's thirty-one sera they had no case in which the pneumococcus could not be identified. The micro-agglu-

tion technique simplified by the use of mixed sera, was adequate. They found that lobar pneumonia—the most frequent form (78 per cent.) in children over 3 years—was caused in 77 per cent. of cases by Types I and II bronchopneumonia (100 per cent. of pneumonias up to 1 year, 86 per cent. from 1 to 3 years) by Type III and by the organisms of Group A in 78 per cent. of cases. In infancy Types VI and I were most common (each 10 per cent.) and 51.5 per cent. of cases were caused by Types VI I, III II and XIX in that order of frequency. Types XXIV, XXIX, XXX, XXVII and XVI were very rarely met with (less than 1 per cent.) and XXIII XXXI and XXXII not at all. Types VIII X XXIX and XXX always produced localized pneumonia. Toxic forms were usually due to XVIII XIX, III, VI, XV XVI and I and septic forms to IV, XIV, V, XIII XVII and XIX. Bronchopneumonia due to Types VII, X, XV, XII, or XXIX took in general a benign course but pneumonia from Types IV, I II V, XIV, XVII, or XI had a mortality of 40 to 50 per cent. or even more. Only 60 per cent. of convalescents had specific antibodies in the blood; these are produced to only a slight extent in children aged less than 3 years, and even in those aged from 3 to 12 to a considerably less extent than in adults. There was little correspondence between strain virulence, as tested by inoculation in mice and the clinical form or the prognosis of pneumonia in the patient concerned—the course of the malady depending chiefly on non specific defence measures.

396

Agglutinins of Typhoid Carriers

A. PIJPER AND C. G. CROCKER (*S Afr med J* February 27, 1937, p 113), with sixteen years of close co-operation between their laboratory and the public health service, regard the typhoid carrier as the chief source of infection in Pretoria. Few cases of typhoid remain undetected and in all notified ones an exhaustive inquiry is made by an efficient inspector. When a clue as to the source of the infection is found blood tests are performed for the detection of carriers. The authors completely ignore the Widal test with H agglutination only for they have found manifest carriers with no H agglutinins. They use a complement-fixation test and O agglutination in a serum dilution of 1 in 100 with the sensitive strain of Ty 901 or Q 901. Persons showing marked O agglutination (+ +) are investigated further. There is in the authors' opinion no evidence against their assumption that all carriers have O agglutinins. There are however a large number of persons who are not carriers (proved by the particularly fortuitous conditions prevailing in Pretoria) but who have O agglutinins left behind after oral vaccination subcutaneous inoculation or Grasset's endotoxin vaccine. In examining for Vi agglutination the authors believe they have found a new and efficient method of narrowing down the field for cultural examinations. Blood serum is diluted ten times and to it is added an equal quantity of thick suspension of strain Ty 901 killed at 56°C. The mixture is incubated for two hours and centrifuged. Tubes containing 1 ccm are put up in dilutions of 1 in 20 1 in 40 1 in 80, and 1 in 160 in two rows. To one row are added drops of a live saline solution of Ty 2 to the other drops of a locally isolated non-agglutinable strain. Readings are taken after two hours in the incubator and eighteen hours on the bench. Vi agglutinins are much less common than O agglutinins in normal persons typhoid patients and convalescents. In fourteen carriers examined for Vi agglutinins four were manifest carriers and possessed significant quantities of Vi; three were chronic stool carriers in whom no bacilli were demonstrated but who had large quantities of Vi; five had been chronic carriers but at the time of examination no bacilli or Vi agglutinins were discovered; two had been temporary carriers in whom on examination neither bacilli nor Vi agglutinins were discovered. The authors believe that typhoid carriers are characterized by the possession of significant quantities of Vi agglutinins.

In Pernicious and Post-operative Anæmias...

A palatable liquid extract of hog's stomach containing *Hæmopoietin* in stable solution.

The stomachs are treated immediately after killing to extract the Antianæmic Factor in active condition producing a bland liquid of pleasant flavour—HOGASTRIN

A dose of two teaspoonfuls in a little water three times a day for a fortnight, then reduced to one teaspoonful, will invariably give good results in the treatment of all Macrocytic Anæmias

Packed in 4 oz., 8 oz. and 16 oz. bottles.

HOGASTRIN

Manufacturing chemicals for over a century

Two valuable foods compared

CALORIES	PROTEIN	CARBOHYDRATE	FAT
116	10g	10g	
19	1g	14g	2g
MILK	MILK	MILK	MILK
BEMAX	BEMAX	BEMAX	BEMAX
MINERALS	CALCIUM	PHOSPHORUS	IRON
12g	34mg	157mg	
0.2g	16mg	available	Traces
MILK	MILK	MILK	MILK
BEMAX	BEMAX	BEMAX	BEMAX
MANGANESE	VITAMIN A	VITAMIN B ₁	VITAMIN D
4.26mg	280 units	350-400	
Small Traces	90 units	6 units	2-3 units
MILK	MILK	MILK	MILK
BEMAX	BEMAX	BEMAX	BEMAX

The figures are for quantities of 1 oz. each of Milk and Bemax

That the Vitamin B₁ content of Bemax is 60 times that of milk is perhaps not surprising, but the fact that its caloric value is 6 times greater than milk, and its protein and carbohydrate content ten times as high (to quote only

three examples from the above charts) emphasises the high all-round nutritional and therapeutic value of this natural Vitamin tonic food. Special importance probably attaches to the high IRON content of Bemax.

Let us know how you can get a small sample for personal trial use on request.

The Bemax Laboratories (Dept. B 37) 23 Upper Mall, London, W 6

MAW STEROTHERM

HOT AIR ELECTRIC AUTOMATIC STERILIZER

Patent No. 427581

- EFFICIENT AND RAPID STERILIZATION
- SAVES TIME, SPACE AND MONEY

Maw Sterotherm Automatic Sterilizers have been installed in many Hospitals, Surgeries, etc., throughout the country and are functioning with the utmost efficiency. The special features of the Sterotherm ensure complete sterilization of Instruments, Dressings, Oils etc. by the Hot Air method. It is the ideal unit where economy of space and outlay are essential.

May we send you details or arrange a demonstration?

SPECIAL FEATURES

- Automatic regulation of temperature.
- No supervision necessary while in use
- Very small current consumption
- Articles in apparatus remain sterile until required, as closure is bacteria proof
- Dressings quite dry after leaving Sterilizer
- Convenient size—length 16½ inches, diameter 9½ inches

PRICE £20

MODERN AIDS TO HEARING

These announcements are intended to illustrate the latest advances in acoustic science in order that the medical profession may be kept informed of the newest aids available for the deaf.

"Electro-Ear"

Micro telephone wearable aid comprising only two parts: a very small earpiece and the transmitter case. A small battery is housed inside the case and this new design embodies a combined slider switch and volume control conveniently placed. It is a very helpful aid for most cases of middle ear deafness and can be worn easily and inconspicuously for business or home use.

A copy of our new booklet describing all types of aids will gladly be sent on request.

In almost every case of amputation of the breast there follows a depressing psychological sequel due to the sense of embarrassment felt by the patient owing to the loss of the normal figure line. Happily this natural contour can now be immediately restored and self-confidence regained by wearing a SALTAIR ARTIFICIAL BREAST and brassiere. This surgical fitting is designed so that it cannot in any circumstances slip out of position. It is made from the finest resilient sponge rubber and can even be worn while bathing for it is easily dried and practically non absorbent. With a beautifully smooth surface covered flesh silk the Breast is available in various sizes of an average weight of only two ounces. THE SALTAIR ARTIFICIAL BREAST can be supplied without brassiere if the patient prefers to sew it into her own foundation garment. Special pamphlet post free upon request by any Doctor.

BRINGING THEM BACK ALIVE...

*from
the
Autoclave*

Time and time again they do it. Even after enough sterilization to put an end to many brands of rubber gloves, Seamless Standard Latex Surgeons' Gloves come back alive and elastic.

While you are getting this extra wear, you have the fine operating features of greater thinness and tactility. Your touch is delicate and sensitive—yet the friction is there for a firm grip. Fingers are free—never cramped. In short, you virtually forget you have gloves on.

Test these remarkable gloves yourself. Try on a pair. Wet them. Note the firmness with which you can grasp and manipulate instruments. Test their strength at the wrist, and note the uniformity of the tissue thinness of the fingers.

Try these famous gloves—the 'most money can buy'. Made by the manufacturers of the famous *Madon* Surgeons' Gloves, unequalled at their price.

ST. ANDREW'S HOSPITAL FOR MENTAL DISORDERS NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY

President: THE MOST HON. THE MARQUESS OF EXETER C.M.G. A.D.C.

Medical Superintendent: DANIEL F. RAMBAUT M.A., M.D.

This registered Hospital is situated in 10 acres of park and pleasure grounds. Voluntary patients who are suffering from incipient mental disorders or who wish to prevent recurrent attacks of mental trouble, temporary patients and certified patients of both sexes are received for treatment. Careful clinical, biochemical, bacteriological and pathological examinations. Private rooms with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE

This is a Reception Hospital in detached grounds with a separate entrance to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical bath, Phlebomyel treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray room, an Ultra Violet Apparatus, and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological and pathological research.

MOULTON PARK

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit, and vegetables are supplied to the Hospital from the farm, gardens and orchards of Moulton Park. Occupational Therapy is a feature of this branch and patients are given every facility for occupying themselves in farming, gardening, and fruit growing.

BRYN-Y-NEUADD HALL.

The seaside house of St. Andrew's Hospital is beautifully situated in a Park of 350 acres, Llanfairfechan, and the finest scenery in North Wales. On the North West side of the Estate, a mile of sea coast forms the boundary. Patients may visit this Branch for a short sea-side change or for longer periods. The Hospital has its own private bathing house on the sea shore. There is trout-fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses, and bowling greens. Ladies and gentlemen have their own gardens and facilities are provided for handicrafts such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 236 and 2357 Northampton) who can be seen in London by appointment.

"IT'S QUICKER BY RAIL"

Choose a Spa in Czechoslovakia . . .

The Spas and Health Resorts of Czechoslovakia, with their centuries-old tradition of healing, reinforced by the experience and researches of local specialists invite your serious consideration

PISTANY (Piestany)	In addition to places of world wide repute such as	MARIENBAD (Mariánské Lázně)	FRANZENBAD (Františkovy Lázně)
ST JOACHIMSTHAL (Jáchymov)	CARLSBAD (Karlovy Vary)	LUHACOVICE	TRENCIANSKE TEPLICE
	TEPLICE SANOV (Teplitz-Schönauf)	SI I AČ	

with their medicinal springs and mud baths there are numerous smaller spas and health resorts admirably equipped for the treatment of many diseases including those in the following groups

ANAEMIA AND CHLOROSIS
BASEDOW'S DISEASE
BRONCHIAL CATARRH
CONSTITUTIONAL DISEASES
SCROFULA RICKETS
DIGESTIVE DISEASES
DISEASES OF THE BLADDER
AND URINARY ORGANS
DISEASES OF THE KIDNEYS
DISEASES OF THE NOSE AND THROAT

DISEASES OF WOMEN
DISORDERS OF BONES
MUSCLES AND JOINTS
DISORDERS OF THE HEART
DISORDERS OF METABOLISM
AND GOUT
GALLSTONES
LEUCAEMIA
NERVOUS DISEASES AND POST
HEMIPLEGIC CONDITIONS
TUBERCULOSIS OF THE LUNGS

The arrangements in the bath establishments are up-to-date in every way the cleanliness and neatness proverbial the service attentive and courteous.

It is accepted that a spa cure to be fully beneficial should provide a complete change of surroundings and a break with the patient's normal everyday life

The Czechoslovak Spas fulfil this purpose admirably comfortable hotels first-class orchestras and dance bands every facility for sport—tennis golf swimming riding fishing, etc

There are also numerous fully up-to-date homes for convalescence and rest cures

POSTAL and ORAL TUTOR

Full details of above and Private Tuition—
H C ORAIN, F.R.C.S., Surgeon's Hall Edinburgh.

COUNTY BOROUGH OF HUDDERSFIELD ASSISTANT SCHOOL MEDICAL OFFICER.

Applications are invited for the above post, for
which a good knowledge of diseases of children
and experience in bacteriology are essential.
Salary according to scale—£500 per annum
increasing to £700. The commencing salary will
be based on the candidate's previous experience.
The post is designated under the Superannuation
Act, 1920, and the appointment therefore is sub-
ject to a satisfactory medical examination.
Applications, stating age, and giving full par-
ticulars regarding training, qualifications, and
appointments held since qualification, should be
forwarded to the Medical Officer of Health along
with copies of two recent testimonials so as to
reach him not later than Thursday May 20th 1937

COUNTY COUNCIL OF MIDDLESEX ASSISTANT DENTAL OFFICER

Applications are invited for the above appoint-
ment on the pensionable staff. Applicants must be
fully qualified and registered Dental Surgeons.
The duties of the post include the dental inspec-
tion and treatment of school children and of women
and young children under the Maternity and Child
Welfare Act.

The officer appointed will be required to devote
whole time to the duties of the post, and will not be
allowed to engage in private practice, and will work
under the supervision of the County Medical
Officer and the Senior Dental Officer.
Salary £500 per annum rising by annual incre-
ments of £25 to £700 together with out-of-pocket
travelling expenses while on duty.

The appointment will be held during the pleasure
of the Council and terminable by one month's
notice on either side.

Applications stating age, qualifications, and ex-
perience together with copies of not more than
three recent testimonials must be received by the
undersigned not later than May 31st.

Relationship to any member or officer of the
Council must be disclosed in the application. Appli-
cation forms are not provided. Envelopes must be
endorsed "Assistant Dental Officer."

Canvassing directly or indirectly will be a dis-
qualification.

C W RADCLIFFE, Z
Middlesex Guildhall Clerk of the County
Westminster S W 1 Council
May 5th 1937

COUNTY BOROUGH OF BARNSELY ST HELEN MUNICIPAL GENERAL HOSPITAL. (150 Beds.)

APPOINTMENT OF MEDICAL OFFICER (MALE)

Applications are invited for the above whole
time appointment at an inclusive salary of £650
per annum rising by annual increments of £25 to
£700 per annum.

The Hospital was appropriated for administra-
tion under the Public Health Acts on April 1st,
1936.

The officer appointed will be on the staff of the
Public Health Department, and the appointment
will be determinable by three months' notice on
either side. The successful applicant will act also
as Medical Officer for the adjacent Institution and
for the Municipal Maternity Home, and may be
called upon to act in a consultant capacity for the
maternity services of the Borough. He will for the
first instance be permitted to reside outside the
hospital precincts within such reasonable distance
as the Council may agree.

Candidates must have held resident appointments.
A high medical qualification wide obstetrical ex-
perience and experience in hospital administration
are desirable.

It is contemplated that the hospital will be de-
veloped mainly for medical and obstetrical cases
and that in the near future there will be made an
appointment of Resident Medical Superintendent
when the Medical Officer will then be considered
for promotion to such appointment.

Applications stating age, qualifications etc.
together with copies of not more than three recent
testimonials, must be sent to reach me not later
than first post on Thursday May 20th 1937, and
should be endorsed "Medical Officer St Helen
Hospital."

Canvassing in any form will be a disqualification.
Town Hall Barnsley
April 26th 1937 A E GILFILLAN Town Clerk

TIPTON URBAN DISTRICT COUNCIL MEDICAL OFFICER OF HEALTH AND SCHOOL MEDICAL OFFICER

The Council invite applications for the appoint-
ment of Medical Officer of Health and School
Medical Officer for the Urban District of Tipton
at a salary of £800 per annum.

Applicants must be duly qualified Medical
Practitioners and must hold a Diploma in Sanitary
Science, Public Health or State Medicine.

The person appointed will be required to de-
vote the whole of his time to the duties of the
office and will not be allowed to engage in private
practice. He will be responsible for carrying out
all the duties imposed on a Medical Officer of
Health and School Medical Officer by the various
Acts Orders and Regulations relating to public
health, maternity and child welfare, education,
housing and infectious diseases and such other
duties as may from time to time be prescribed by
the Council.

The appointment will be subject to the approval
of the Minister of Health and the Board of
Education and to the person appointed agreeing to
give three months' notice in writing before
terminating the office.

Applications (in forms to be obtained from the
undersigned) accompanied by copies of not more
than three recent testimonials, must reach the
undersigned not later than May 31st 1937.
Canvassing will be disqualified.

KENNETH W. MADIN
Municipal Buildings Clerk of the Council
Sedgley Road West Tipton.
May 7th 1937

COUNTY COUNCIL OF MIDDLESEX WEST MIDDLESEX COUNTY HOSPITAL ISLEWORTH

CASUALTY MEDICAL OFFICER (non-resident)

Applications are invited from registered Medical
Practitioners for the above appointment. Can-
didates must have held the posts of both house
physician and house surgeon at a general hospital
and have had considerable all round experience.
Salary £350 per annum with a cash allowance
in lieu of board and residence at the rate of £100
per annum. No other emoluments.

The officer appointed will be required to deal
with casualties and admissions to the hospital and
to carry out such other duties as may be allotted
to him. The hours of duty are 10 a.m. to 6 p.m.
daily with Saturday afternoons and Sundays free.

The appointment is for a period of six months
in the first instance may be extended for an ad-
ditional six months and is terminable by one
month's notice on either side.

The officer appointed will work under the con-
trol of the Medical Superintendent and will devote his
whole time to official duties and will have no
rights under the Council's superannuation scheme.

Applications stating age, qualifications, and ex-
perience together with copies of not more than
three recent testimonials must be received by the
undersigned not later than May 29th. Application
forms are not provided. Envelopes must be en-
dorsed "Casualty Medical Officer West Middlesex
County Hospital." Relationship to any member
or officer of the Council must be disclosed in the
application.

The Resident Staff consists of an R.S.O. a House Surgeon a House Physician, and a Casualty Officer.

In addition to his duties in the Casualty Department the Casualty Officer is also responsible for the In-patient and Out-patient work in connection with the Eye and Ear, Nose and Throat Departments.

The appointment is for six months at a salary at the rate of £140 per annum with board residence and laundry and the successful candidate will be expected to commence duties immediately.

Applications, stating age, qualifications and nationality together with copies of three recent testimonials are to be forwarded to the undersigned as soon as possible, endorsed "Casualty Officer".

Further particulars may be had on application,
H. WILKINSON, Supt.

THE GLOUCESTERSHIRE ROYAL INFIRMARY AND EYE INSTITUTION GLOUCESTER

(3 Beds. Five Residents)

Applications are invited for the post of HOUSE PHYSICIAN (male). Salary at the rate of £140 per annum with board residence and laundry.

The appointment is for six months which may be extended for similar periods by re-election from time to time.

Applications, stating age, qualifications, and nationality with copies of not less than three recent testimonials should be sent to the undersigned not later than Thursday May 14th.

The elected candidate will be required to enter upon his duties on June 4th.

April 29th, 1937

F. J. SYMONS
Secretary

DOWN COUNTY MENTAL HOSPITAL, Downpatrick Northern Ireland

JUNIOR ASSISTANT MEDICAL OFFICER (male)

The Committee of Management will at its meeting on May 29th 1937 consider applications for the above post. Salary £350 per annum rising by annual increments of £25 to £450 per annum plus £50 per annum if the applicant possesses or obtains the Diploma in Psychological Medicine with emoluments of furnished apartments, rationals, laundry fuel light and attendance, valued for pensionable purposes at £130 of which the present ration allowance £52 per annum is commuted for cash. A deduction of 3 per cent. will be made from the salary and allowances under the Asylum Officers Superannuation Act 1909.

Candidates must be registered unmarried and not more than 30 years old. Previous Mental Hospital experience not necessary. Proficiency in bacteriological and pathological technique a recommendation.

Forms of application giving further particulars, may be obtained from the Resident Medical Superintendent up to May 22nd 1937.

MANCHESTER AND SALFORD HOSPITAL FOR DISEASES OF THE SKIN

Two ASSISTANT MEDICAL OFFICERS wanted. Fully qualified and registered. To attend three mornings per week each. Salary £100 per annum. The appointments are for twelve months from July 1st. Applications with copies of three testimonials to be sent to the undersigned on or before May 24th.

JOHN NALL Secretary

LIVERPOOL HEART HOSPITAL, 34 Oxford Street Liverpool

Applications are invited for the position of HONORARY ASSISTANT PHYSICIAN to the above Hospital. Applications to be sent to the Secretary at the above address.

EAST SUSSEX COUNTY MENTAL HOSPITAL, HELLINGLY SUSSEX

APPOINTMENT OF SENIOR ASSISTANT MEDICAL OFFICER

Applications are invited for the post of Senior Assistant Medical Officer (registered and qualified) at the above Mental Hospital. Salary £600 per annum (which includes £50 for D.P.M.) together with the usual emoluments of board lodging and washing valued for superannuation purposes at £90 per annum. Arrangements can be made for a married Medical Officer.

Candidates must possess the Diploma in Psychological Medicine, and be interested in PSYCHO THERAPY. The hospital possesses a well-equipped laboratory and four out-patient clinics are held in voluntary hospitals in East Sussex. The appointment will be subject to the provisions of the Asylum Officers Superannuation Act 1909 and may be terminated by one calendar month's notice on either side.

Applications with copies of three recent testimonials, stating age and full particulars to be sent to the Medical Superintendent not later than May 21st 1937.

ROYAL DEVON AND EXETER HOSPITAL, EXETER

HOUSE SURGEON (male) to the EAR, NOSE AND THROAT DEPARTMENT

Applications are invited for this post, which is now vacant.

The appointment is for six months but candidates are eligible for re-election.

Salary at the rate of £150 per annum with board lodging and washing.

Applications giving particulars as to age and qualifications together with copies of three recent testimonials should be sent to the undersigned as soon as possible.

May 3rd 1937

“FOR better results”—is the watchword in producing Agarol. A mineral oil emulsion of highest grade ingredients obtainable, prepared with the efficiency of seasoned experience, cannot but be dependable. Its effectiveness is a reliable aid in teaching the intestinal tract to “keep hours,” its exceptional palatability makes the taking of medicine easy and reasonably pleasant. § Agarol Brand Compound is the original mineral oil and agar-agar emulsion with phenolphthalein. It contains no artificial flavouring, no sugar, alcohol, or alkali. Trial supply sent on request.

THE BEST VEHICLE OF THE VITAMIN B COMPLEX

ALUZYME NON-AUTOLYSED YEAST

Aluzyme is plain Brewers' Yeast, purified, dried, and stabilised by a process which leaves the cells intact. Consequently, Aluzyme provides the whole of the Vitamin B Complex, nuclein, and other constituents, in the fully active state of living substance. It is by far the best Yeast preparation for all therapeutic purposes.

COMPARE THESE VALUES

The Officially certified Vitamin Potencies of Aluzyme are as follows —

B1 1140 International Units per Ounce,
B2 Complex Maximum for Dried Yeast.

The Sulphur content is 0.47 per cent and the glutathione reaction is particularly brilliant

Aluzyme is recommended in all conditions attributable to B avitaminosis in toxæmias and certain digestive troubles and as a general adjuvant in affections of the skin. It has been given with good results with calcium sulphide in furunculosis, and with iron in anaemia.

Supplied for dispensing in bottles of 1000 and 500 Tablets. Obtainable in Northern Ireland from Thos McMullan & Co., Ltd., Victoria Street Belfast in IFS from May Roberts (Ireland) Ltd., Grand Canal Quay Dublin. Professional samples descriptive memoranda and prices on request.

ROSE AND CARLESS SURGERY

CORONATION EDITION

THE FIFTEENTH EDITION WILL BE PUBLISHED ON MAY 25th. It bears on its covers the effigies of Their Majesties embossed in gold from dies struck by the Royal Mint, together with the St Edward Crown and the King's Royal Sceptre.

The book remains *the* outstanding textbook in the field of surgery. This revision comprises more important changes and additions than any previous one. 242 new illustrations have been added and two new chapters have been introduced. It now contains 953 illustrations and eighteen coloured plates.

To the student, Rose and Carless is an essential textbook. To the general practitioner it gives the diagnosis, surgical procedure and post-operative treatment in full and right up to date.

Crepe
Bandages
for
Medical
Practice

This booklet contains valuable information concerning the many useful functions of the crepe bandage in every day use. Written by an eminent medical authority it is a handbook well worth possessing. The Nordic crepe bandage known and recommended for its remarkable elasticity which is attained by a special weaving process does not contain rubber in any form. It is given special mention in this interesting booklet. POST FREE on application to —

Material is very elastic, cream or
flesh cloths

ZÖPLA ON WHITE FELT

is coming to the fore. Used as a padding and for protection. Does not become hard in use, and is long lasting. Many thicknesses and compressions.

In co-operation with the Medical Profession J. Roussel evolved his Belts

The patent Roussel elastic weave, which allows variations in tension over different parts of a belt enables J Roussel to model a belt for every individual case. Surgeons and doctors can prescribe a belt by J Roussel with confidence knowing that, with the Varied Tensions feature the belt can be made to exact measure and to extend beneficial support and pressure exactly where required.

The Linia Belt for Women

For post-operation or post maternity, cases of ptosis, etc. Supports without exercising harmful pressure or interfering with circulation. Does not encourage atonic condition of muscular tissues. While being designed was frequently submitted for surgical opinion. Specimen belt sent on request.

From 2 gns. Post orders can be executed on receipt of measurements.

Price reduction to members of the Medical Profession

A reduction of 2/ in the £ is made on purchases for personal use by members of the Medical Profession. Write to Dept. M.E.

On Sale Only at J Roussel, Ltd., Telephone 179-181, Regent St., London, W 1. *Agents 65-71*

Also at Manchester Liverpool Southport Birmingham Leicester Bristol Bournemouth Hove Edinburgh and Glasgow

The belt for everyday wear healthy anatomically correct, for the normal woman or too stout woman. Six months adjustment service sold only at J Roussel salons From 2 Gns

Thin telcot of great strength can be extended as required. Sanitary pad can be attached.

Tough horizontal elastic can be regulated to required tension. Adjustments can be made during progress of the case.

"CERABAN"

ADHESIVE
SELF-SUPPORTING

BANDAGE

The Supplementary or Alternative Treatment to Self-Adhesive Elastic Bandages for
SPRAINS, DISLOCATIONS, CONUSIONS, SWELLINGS, VARICOSE VEINS, VARICOSE ULCERS, etc

Its use eliminates the risk of Dermatitis which so frequently arises from the application of Self adhesive Bandages

"CERABAN" whilst free from rubber, possesses elastic properties and when carefully applied to the limb gives substantial support. It is porous, adhesive, and non-irritating will not chafe and permits of complete respiration of the skin.

In the treatment of Varicose Ulcers the use of "Ceraban" Bandage eliminates the risk of Dermatitis which occasionally occurs through the application of self adhesive Elastic Bandages. In the less severe of such cases a distinguished authority writing in the *Lancet* page 580 Sept 7th 1935, *issue* recommends the use of "Ceraban" Bandage cut in strips as a first and protective dressing prior to covering with self adhesive Elastic Bandage and in the more serious cases the complete replacement by "Ceraban". It is waterproof, antiseptic, and being spread on an extensible material readily conforms to the shape of the limb and therefore will not slip.

ANTERIOR-POSTERIOR PRESSURE FOR THE MOST SATISFACTORY SUPPORT

Effective support without constriction is made possible by the anterior-posterior pressure given by the Curtis Abdominal Support No 1. This support one of over 100 abdominal appliances made by Curtis gives steady permanent support where it is most needed. Yet it is extremely light in weight and very comfortable in wear giving perfect freedom to the hips. Medical Authorities throughout the world approve the Curtis Abdominal Support No 1 and prescribe it for all cases where support upward and backwards of the lower abdomen is essential.

*These 5 layers give you
the full flavour
and no bits
in the*

There is a good reason for the wide recommendation of "du Maurier" cigarettes by the medical profession. The filter tip ensures no bits in the mouth. Three layers of pure white vegetable tissue interleaved by two layers of cellulose fibre keep every hint of irritation from a sensitive throat. And "du Maurier" are made with both plain and cork tips.

Salt and Son Ltd.

1793.....1937

During
8
Reigns

George III
George IV
William IV
Victoria
Edward VII
George V
Edward VIII

— and now —

George VI

Founded in the year 1793, in the
reign of George III, the House of Salt

has a history of continuous Progress during eight reigns. Constantly under the personal supervision of members of the same family the SALTAIR SURGICAL SERVICE has worked in close co-operation with the medical profession. During nearly a century and a half of unceasing activity many revolutionary changes and improvements have been effected in the designs of the wide range of Surgical Appliances produced by SALTS, while the confidence of medical men has been treasured by the firm and still further encouraged by the unequivocal Guarantee which appears at the head of every announcement issued on behalf of this House—advertisements which have been strictly confined to the medical press.

And now, in this present momentous year, in the early months of a new reign, SALTS confidently look forward to the future and pledge themselves anew to maintain both the Quality of their products and the efficiency of their Service.

ECZEMA

Relief and cure with Peat ointment

Because eczema generally brings pain and itching, any local dressing should attempt soothing as well as healing And this is the great virtue of Sphagnol-peat ointment—that from its first touch, it gives coolness and comfort to tender skin

Many doctors find Sphagnol so successful that they are prompted to write about it. Here is an extract from one of the letters we have received

Thank you for the ointment I have tried it on an incipient case of local eczematous trouble and found it to give great relief and to arrest the manifestation"
Signed (Dr) R. L.

Test Sphagnol personally On receipt of a postcard we shall be pleased to send you a sufficient supply

For Rectal and Anal Disorders

WHATEVER be the underlying cause of rectal or anal disease, logical medical treatment includes measures for rendering the motions as soft and un-irritating as possible. Even after operation this holds good, since the area must be protected against irritation.

'Cristolax' provides an eminently satisfactory lubricant which can be applied with benefit in such conditions. Apart from ensuring soft, easy stools its bland nature soothes and protects inflamed surfaces, tends to relieve congestion and effectively assists in healing.

'Cristolax' presents pure medicinal paraffin of optimum viscosity in elegant combination with 'Wander' Dry Malt Extract. Being entirely free from any oily or disagreeable taste it is easy to administer and its use does not give rise to the unpleasant symptom of "leakage."

MANDELIX

(Elixir of Ammonium Mandelate B.D.H.)

In Urinary Tract Infections

The administration of Mandelix, a palatable elixir of ammonium mandelate, in urinary tract infections is followed, in the majority of cases—even in those having a chronic infection—by most satisfactory results, a sterile urine being produced usually in the course of a week.

Modern Iron Therapy

Iron 'Jelloids' are an elegant and reliable means of administering the proto-carbonate of iron. The preparation has none of the disadvantages of Pil Blaud. The iron content remains fresh and unoxidized indefinitely, and injury to the teeth is avoided.

The 'Jelloids' are highly effective in the treatment of achlorhydric anæmia and indeed in all the simple anæmias in which massive iron therapy is indicated.

Iron Jelloids

You are cordially invited to apply for samples for clinical test.

OESTROFORM

In the treatment of menopausal disturbances

Some of the more severe symptoms of menopausal disturbances may require intensive treatment with Oestroform parenterally administered.

Most cases, however, respond to treatment with Oestroform given orally. Treatment should begin with small doses (1,000 international units two or three times daily) followed by rapidly increasing doses up to 10,000 units two to

four times daily. As soon as the symptoms have subsided, the doses should be decreased as rapidly as the reasonable comfort of the patient will allow.

Such other conditions as kraurosis vulvæ may be treated with Oestroform per vaginam in the form of pessaries, one being inserted once or twice daily.

Oral and vaginal therapy may be carried out simultaneously.

Today many physicians find great convenience in the use of Argyrol tablets. These tablets are pure Argyrol Brand Silver Vitellin, no binder being used. They not only insure accuracy, purity and genuineness but also save time because a fresh, potent solution is thus made available at a moment's notice in the doctor's office, in the operating room and at the bedside. Argyrol is a unique compound. It is interesting to note that among the mild silver proteins on the

"ARGYROL" TABLETS
BRAND SILVER VITELLIN
**for convenient, exact,
fresh solutions**

market there is a wide variation in hydrogen ion concentration from less than seven to more than eleven. This means that some products are very much more alkaline than others. This fact no doubt has much to do with the irritation noted by doctors when Argyrol substitutes are used in place of Argyrol. Argyrol's hydrogen ion concentration is always close to nine regardless of the solution used. Argyrol is not only an efficient bactericide, it has the tremendous advantage of being non irritating and sedative to inflamed mucous membrane and it possesses the further advantage of being absolutely harmless to the most delicate tissues.

A purified fraction of
liver extract possessing
remarkable hæmopoietic properties

NEO-HEPATEX

(PARENTERAL)

For intramuscular or intravenous use

Neo-Hepatex (parenteral) is the result of an original process designed to conserve the maximum amount of the active hæmopoietic fraction of liver, and is prepared under the supervision of a staff of biologists with ten years' experience in research work on liver extracts

In addition, each batch is clinically tested in hospital. This ensures the high and consistent clinical activity which has made Neo-Hepatex an accepted standard in parenteral liver therapy the world over. A copy of the relative clinical test chart is enclosed in each box.

Neo-Hepatex may be administered in any dosage demanded by the condition of the patient, its clinical potency enabling the clinician to give a more than adequate dosage in small volume.

Neo-Hepatex is issued in Ampoules.

Boxes of 6 x 1 cc - 5/- 6 x 2 cc - 7/6 3 x 4 cc - 6/6

The high potency of Neo-Hepatex renders it most economical in cost.

PERTUSSIS SOLUBLE ANTIGEN

for the
intra-nasal treatment of Pertussis

Specific Biologic treatment of certain types of infection, such as Whooping Cough, by means of local immunisation or desensitisation has been recently advanced

The antigens commonly applied are in solution form and these antigens have been prepared by the Mulford Biological Laboratories and are offered under the name PERTUSSIS SOLUBLE ANTIGEN. The product is a sterile solution of substances derived from recently isolated cultures of *Hemophilus Pertussis* and is administered by instilling a few drops into each nostril.

Clinical trials have given encouraging results and show that 88% of the cases treated early in the paroxysmal stage were benefited, and 40% of those treated late in the disease were relieved. Several positive contacts treated with Pertussis Soluble Antigen by intra-nasal application did not develop Whooping Cough. Pertussis Soluble Antigen is supplied in 5-cc vials with dropper.

|--|--|

PROSTATITIS

From information received —

The Cystopurin—I had good results in one case. A man of about 64 with a small fibrous prostate suffering from frequency and retention. Three tablets daily cleared up his symptoms in six weeks except for a little nocturnal frequency but all pain straining and scalding had gone. He had been on various mixtures before for three months with no result."

"I am very pleased to say that Cystopurin is certainly having satisfactory results with a case of cystitis due to cancer of the bladder. I find it also satisfactory in gonorrhoea and prostatitis."

In a case of chronic prostatitis and cystitis in a man aged 64 Cystopurin greatly improved the condition of urine and frequency of micturition. Patient has had lately very good nights. Bacterial examination, no pus in urine.

I have pleasure in reporting to you on my experience of Cystopurin. I have in the past used it in intractable cases of cystitis or prostatitis and have had very good results.

"Male aged 56. This man had delayed coming forward for treatment for about a month and was in a very serious condition. He had an acute urethritis with prostatitis and orchitis, the testicle being about the size of an orange. His temperature was 103.4° F. Pain was extreme and he was afraid to micturate. He was put on treatment at once but with very poor results. I administered Cystopurin tablets in the dose of two t.i.d. At the end of the third day an improvement was noticed the temperature having fallen to 100° F. The dose was then increased to three t.i.d. At the end of a fortnight the prostate was considerably reduced in size and much less tender and the testicle was nearly normal in size and painless. Progress was thereafter uninterrupted the first negative smear being returned much sooner than was anticipated. The dose of three tablets t.i.d. was reduced to one t.i.d. when the temperature became normal on the seventh day.

"I am sure that this man's illness would have been of much longer duration but for Cystopurin.

Supplied in bulk and in tubes of 20 tablets for dispensing purposes.

Samples and literature available on request to

GENATOSAN LIMITED, Loughborough, Leicestershire

Literature and samples free on application

P. A. B. S. (HEWLETT'S)

Under this easily remembered title we have introduced the new chemo therapeutic compound Para amino benzene sulphonamide which is indicated in puerperal sepsis erysipelas scarlet fever streptococcal inflammation of the throat and tonsils meningitis and streptococcal arthritis

Supplied in 7½ grain tablets the dose being 2 or 3 tablets daily after meals which may be reduced as the symptoms subside

SYRUP. AMMONII MANDELAT. (HEWLETT'S)

A new preparation of Ammonium Mandelate in the form of a pleasant orange flavoured syrup for the treatment of Urinary Infections The full dose of 3 grammes of Mandelic Acid is contained in 2 teaspoonfuls of the syrup and in normal cases no Ammonium Chloride or other additional drug is necessary

FORMALGAR

(Formerly known as Gargar Formalin Co)

A most economical efficient and pleasant gargle and mouth wash containing Formalin Glyc Acid Carbolic Tinct Pyrethri &c., suitably flavoured It is highly concentrated one fluid drachm being sufficient for an eight ounce bottle

Dr G. H. speaks very highly of Gargarisina Formalin Co used twice daily (Gargle—1 drachm to 5 oz. water) for throat irritation in professional singers

HEWSOL

A non-poisonous non-corrosive germicide with a fragrant pine odour having a Rideal Walker Carbolic Acid Co-efficient of 5

It is superior to Ioline Iysol &c. being non-staining and non-irritating and it forms a perfect emulsion with ordinary tap water in all proportions

In 1 pint bottles 2 gallon W. Qts. and 1 gallon tins

UNG. IODERMOL

It has been found most useful for Enlarged Glands Rheumatic and Gouty Affections Lumbago Sciatica Swollen and Stiff Joints Skin Diseases &c.

UNGUENTUM IODERMOL et METHYL SALICYL (HEWLETT'S)

Containing about 5% of Iodine in a stainless non-irritating form together with 5% Methyl Salicylate Useful in the treatment of Enlarged Joints Synovitis Rheumatoid Affections &c.

VERONIGEN

A liquid preparation of the Hypnotic Barbitone or Diethyl Barbituric Acid has long been deemed as a useful means of procuring sleep When given in reasonable doses it is claimed that it does not produce any toxic symptoms whatever and in ordinary cases of insomnia one fluid drachm of Veronigen is quite a sufficient dose for an adult

Dose for Adults—One fluid drachm diluted about one hour before going to bed
For Children—1/2 to 1 drachm diluted —10 to 20 minutes diluted

*A major operation in progress
in the operating theatre of a
London Hospital*

THE LESSON OF ANTISEPTICS

LISTER'S discovery that suppuration of wounds was caused by bacterial infection and could be prevented by the use of antiseptics opened the way to the marvels of modern surgery. To-day, it is taken for granted that every operation will be carried out without the introduction of micro-organisms into the blood.

Recognition of the importance of germ-free cleanliness however, is no longer confined to the operating theatre and surgery it receives ever-increasing attention from the lay public. Health standards to-day are higher than they have ever been as a result. Naturally elaborate precautions against infection are impracticable in everyday life, but fortunately adequate protection is provided by the liberal use of soap and water—provided that the soap is pure and has antiseptic qualities.

Wright's Coal Tar Soap has enjoyed the confidence of the medical profession for over 70 years. Leading bacteriologists advocate its use for everyday protection against infection and it has been found that more doctors use Wright's than any other brand of toilet soap. Wright's has substantial antiseptic and antipruritic qualities, and is the only soap to contain

'liquor carbonis detergens' (Wright's), the valuable skin therapeutic used and recommended by the foremost dermatologists. You can use and recommend Wright's Coal Tar Soap with every confidence.

to be successful in diagnosis and treatment. Taking a history of a patient seen for the first time is often a task requiring patience, tact, judgement, and sympathy. I believe that in our medical schools to-day more attention is being paid to instruction in the taking of histories, and I find that as a rule the practitioner nowadays keeps careful and documented notes of his patient's previous illnesses and records of any investigations which have been carried out. In my own work I prefer if possible to take out the history myself. By so doing it is possible to get in touch with the patient more intimately, to find out his own perspective of his symptoms, to assess his personality, and often to get in sight of a diagnosis, or at any rate to narrow down the list of possibilities and limit the necessary special investigations. It is often possible while doing so to form a perspective of the patient's complaints and then to elucidate obscurities by appropriate questions. The inquiries into occupation, diet, habits, home life, hobbies, and amusements are often revealing, and may afford suggestions in regard both to diagnosis and to treatment.

In any case of illness, even where the diagnosis appears obvious, examination should be as thorough and methodical as possible unless the condition of the patient is too bad to permit of this and the need for treatment is urgent and immediate. Personally I use a routine from which I rarely depart, embracing a brief review of all the systems, but devoting special attention to that chiefly involved. I am convinced that such a routine lessens the chances of making mistakes through missing some essential feature in the patient's condition, and is better than immediate concentration on establishing the apparently obvious diagnosis. It is like looking first at a specimen under the low power of the microscope to get a general impression and then using the high power to focus details and refinements.

Perspective in Diagnosis

The numerous aids to diagnosis which modern research has afforded us are so easily available in hospital and institutional work that there is a tendency to rely upon them to employ them as a routine and to use them as the first approach to diagnosis rather than after careful clinical observation. This in my opinion is a wrong perspective of their use. I yield to no one in my admiration for and appreciation of the valuable aid given in the study of disease by clinical laboratory methods, bacteriological investigation and biochemical tests. I employ them whenever possible in private practice, but I try to be selective, to use only the essential ones to supplement the full clinical investigation, not to supplant any part of it and not to precede it, in other words, to support and extend the clinical diagnosis, or to negative it and give fresh aids to the correct one. Let us not forget that even laboratory methods involve a human factor, depending as they do upon the interpretation of observed data, and that they are therefore not infallible.

In all difficult cases and in those with a prolonged course it is essential to keep an open mind and not try to fit in subsequent developments to the original diagnosis if they seem in the slightest degree to contradict it. It is wise from time to time to start again as it were and regard the problem as a fresh one looking at it from a different standpoint. I am reminded of the importance of the point of view in an illustration I read in the preface to a book I have not so far been able to trace. A church was situated half way up a hill. It looked very different when seen from above and from below but

it was the same church. Everything depends on the point of view. The problem in the patient is the same problem, but a different attitude in its approach may prove illuminating. I am always suspicious of a double or composite diagnosis in a difficult case. It is like a picture with two horizons, and is usually out of drawing.

I am very much impressed with the fact that physicians with great experience of post mortem work rarely make 'tall' diagnoses, but often make brilliant suggestions in difficult cases from their wide knowledge of the distribution of the effects of disease. I lament the tendency nowadays for aspirants to hospital posts to avoid the routine of the performance of post mortems as pathologists, which formerly was almost the routine preparation for the staff.

Perspective in Prognosis

Prognosis is admittedly one of the most difficult problems in the practice of medicine. It depends upon so many factors some of which are capable of expression statistically, while others are almost imponderable. In any given case its assessment depends upon an accurate estimation of the patient, together with the extent, nature, and character of his malady, but even then the individual experience of the practitioner is apt to influence his opinion more than a statistical statement as to the average.

Of one thing I am convinced, and that is of the wisdom of being hopeful even if the outlook is grave, and if possible infusing that hopefulness into the patient and those around him, whether relatives or nurses. In this connexion I may quote Dr G. F. Still, to whose address on 'Perspective in Medicine' I am much indebted. He says, 'Certainly we have no right to close the door of hope so long as there is the smallest possibility of recovery, and adds, "That great clinician, Sir James Goodhart, when he was close on 70 years old said to me apropos of diagnosis, 'The older I grow the more hopeful I grow, and certainly this has been my experience'.

A special case often hard to deal with is the problem of what to tell to a patient with an obviously lethal disease, notably malignant disease of some vital area, such as the bronchi or mediastinum, recognized at a time when any opportunity of eradication or even of lengthy arrest is improbable. I have been much impressed with the fact that in such cases when I have been dreading the direct question from the patient as to the nature of the disease and the outlook, how rarely it is asked. I have felt that the patient suspects but does not want to know. Believing this to be true, I have not often told a patient my suspicions unless I have been deliberately asked by man to man my definite opinion, or unless I know that grave matters are at stake. I repeat that I think this problem one of the most difficult we have to face, with the knowledge that with the best intentions we may make the wrong decision. We must all have seen cases where the announcement that the condition was almost certainly lethal has embittered the last days of a patient's life and accelerated the end. On the other hand I can recall one case where I was forced by the patient's wife to tell him that in my opinion he could not recover. I have never disliked a woman more than I did that one but I was obliged to do as she demanded. I have never admired a man more, he said, 'You mean Doctor, that in the words of a South American proverb I have to pack my biscuits for the journey.' On my answer in the affirmative he sent for his lawyer and his priest arranged his

in great favour, either with the public or the lay press. Religion, medicine and politics appear to be three matters in regard to which nearly everyone seems to feel competent to criticize and to offer suggestions to the experts. The lawyer, accountant, chemist, and engineer, come in for much less comment in regard to their professions, and their opinions are generally accepted. Their only critics are as a rule other members of their own professions. The lay press no doubt contributes largely to this public attitude to our profession. While we must admit with gratitude that the Press is ever ready to help forward any appeal for assistance in regard to the work of our hospitals and other agencies for the aid of the sick, suffering, and needy, it too often seizes on the sensational in medicine and champions the heterodox or the unproven. The fact that the legitimate practitioner of medicine does not advertise no doubt contributes to this attitude of both public and Press. The doctor is a public servant and his actions are often of public interest. His refusal to avail himself of the aid of the Press is misunderstood. It is not to withhold anything helpful but to prevent the exploitation of the public.

The medical press of this country is in my opinion wholly admirable. It is conducted entirely in the public interest and edited with tact and restraint. The best proof of this is the respect in which it is held by the profession and the rarity of any sensational extracts from it in the public press. There is so much that is dramatic and even romantic in medicine and medical research that it is to be regretted that the lay press neglects these aspects for the sensational and the bizarre.

Poise

Poise is a word with many derived meanings. In its original scientific application it is concerned with weight and balance. It has a pleasing sound, as have most words with a pleasant meaning. There is something about its lingering cadence which suggests balance and hovering. Shelley used it in this sense in the line *On poised wings held mute and moveless*. In definition the learned Dr. Johnson again comes to my aid. He defines 'poise' as a regulating power, and then quotes Dryden: 'Men of an unbounded imagination often want the poise of judgement.' I want to stress the idea that poise means more than perspective; it is an artistic balance—a power and judgement with grace and dignity. It must be carefully distinguished from pose. Pose is an attitude, a self-conscious and concerted over-expression of self. It is rather interesting to note that the difference is only an 'i', but it is a capital 'I'. The poseur is an egotist—the man with true poise is usually a philosopher and often an altruist. I often think that some of the general practitioners of my acquaintance have the truest poise in their relations to their patients. I so well remember one distinguished lady who said of her trusted medical adviser: 'He is not our doctor only, he is our very dear friend', and so indeed he was for his advice was sought and followed not only on medical matters but on many of the ordinary affairs of life. Poise in professional conduct is inculcated in the highest degree in the Hippocratic oath, which is often quoted but seldom read.

While we often get gratitude from our patients it must be confessed it often happens that those for whom we do most are those who are least grateful and who sometimes even try to evade their liabilities. I am always suspicious when I hear 'No expense is to be spared, Doctor.' I am reminded of a series of seventeenth-century engravings where the doctor is first represented

as almost divine, then degraded to the rank of angel, then shown as mere man, and is finally represented as satanic when his account is presented.

The same idea occurs in the well known quatrain

God and the doctor we alike adore
But only when in danger not before
The danger o'er both are alike required
God is forgotten and the doctor slighted

How many of us must have wished that we need only see and treat the patients whom we like and who give us their confidence. I have, however, learned one important lesson in poise—that often the patient who is gauche, taciturn, difficult or even rude is self-conscious and shy, and that the attitude is often almost a subconscious protective reaction on his part. If we can get through this shell and probe the real person we can often help him greatly, but it sometimes needs great patience.

The happiest relation between doctor and patient is one of mutual esteem and confidence. The patient who goes behind his doctor's back to get what he calls an unbiased opinion seldom gets the best. On the other hand the doctor who opposes a patient's request for consultation where there is a desire on the part of the patient or his friends for confirmation of an opinion or for help in treatment is lacking in poise, and is often not acting in his own or his patient's best interests. There are, however, some patients who collect doctors' opinions rather than take advice. Such are difficult to help, and they usually drift into the hands of the unorthodox, or crowd the waiting rooms and clinics of foreign specialists whose reputations are not always greatest in their own country. This is not to belittle the value of international consultations. Our work is so responsible and our problems are often so complex that most of us welcome aid from those with greater experience, no matter whence they come. The aim of every true doctor is to help his patient. He can best do so if he knows that his patient trusts him. Money cannot always buy the best. I often think of Kipling's *Last Rhyme of True Thomas*:

And some they give me the good red gold,
And some they give me the white money
And some they give me a clout o' meal
For they be people of low degree

And the song I sing for the counted gold
The same I sing for the white money
But best I sing for the clout o' meal
That simple people given me

My own criterion has been never to recommend or allow anything that I would not permit to one near or dear to me. La Rochefoucauld, probably the greatest writer of crisp epigrams of all time, said: 'It is more necessary to study men than books.' That is most true in our profession, and we must bear in mind that it is a sick, maimed, suffering or sorry fellow-creature that we have to deal with. Oliver St. John Gogarty writes, 'Humanity is all that matters to human beings.' In these days when Robert Burns's wonderful lines 'Man's inhumanity to man' makes countless thousands mourn, seem more than ever true. Let us remember that our profession and we as members of it can and should set an example of true humanity in a world at present almost attuned, or at any rate inured, to cruelty, misery, and suffering. An Edinburgh surgeon, John Chiene, said to his students: 'I always feel when I hurt a patient I have done wrong.' The true perspective in medicine and the true poise in practice are summed up in the golden rule: Do unto others as you would they should do unto you.

ENURESIS IN CHILDREN

A REPORT OF 70 CASES

BY

H. G. MCGREGOR, M.D. M.R.C.P.

Medical Registrar, Royal Sussex County Hospital

This report presents a series of seventy cases of enuresis in children treated for the most part by securing the patient's interest in his own complaint. The cases have been collected during the last seven years from various sources—namely from the children's department of Guy's Hospital during a short period as assistant school medical officer from private practice and from other hospital outpatient departments. The enuresis had in each instance been present since birth, but cases of enuresis in mentally deficient children have not been included.

Object and Technique of Treatment

The procedure was as follows. After taking a detailed history of the number of times involuntary micturition occurred, whether by day and night or by night only of the size of the family and of the presence of enuresis in other members etc. a physical examination was made to exclude organic disease. In the absence of this the child was presented with a small calendar to be kept by the bedside on which the date of each dry night was to be recorded by the patient himself. A small reward was occasionally offered for success in the earlier cases but was not continued as it was found that praise and encouragement were sufficient. In the case of young children unable to read figures the co-operation of the parent was essential. Beyond spending the necessary time to interest the child in these measures and seeing the patient at regular intervals afterwards no treatment was used and no medicines were prescribed.

This very elementary procedure is often all that is required, in the absence of organic disease to put an end to an apparently intractable habit—and frequently a child who has never since birth slept through the night without involuntarily voiding urine can be completely cured in a short while by these means. The treatment is best carried out at a clinic where all cases can attend at the same time and where the atmosphere of competition and enthusiasm that prevails in the waiting room is an adjuvant to success. If, on the other hand organic disease was found and considered to be a predisposing factor appropriate measures were adopted first and the above procedure instituted later when necessary.

Case Reports

The first case is elected because it is typical.

CASE I

David B. aged 7. The youngest of four with no history of enuresis in other members of the family. The parents are of respectable artisan class. He suffered from nocturnal enuresis since birth, with only occasional dry nights. No enuresis during the day. With calendar first week three dry nights second week five dry nights next two weeks ten dry nights cure in four months. Remains cured five years later except for a short period during an attack of measles.

The second is an instance of a successful result in a severe case.

CASE II

Daisy L. aged 9. The elder of a family of two parents of labouring class. Father often out of work but children comparatively well kept. No family history of enuresis. Patient suffered from nocturnal and diurnal enuresis from birth. Had

frequently been scolded without effect—and was unwilling to talk about her habit. Interest easily aroused. Two calendars given one for day and one for night. The mother who co-operated well undertook to see that the child passed urine voluntarily every two hours during the day and night for two weeks. During the first week five dry nights and days during the second five and during the third four. During the next fortnight often went the whole night without having to be disturbed. Cure effected after three months. She has no enuresis now six years later.

The third case was that of a girl of 15 with whom it was not anticipated that the simple method would succeed.

CASE III

Florence T. aged 15. The eldest of three parents comparatively well-to-do. The mother had suffered from nocturnal and diurnal enuresis as a child. The patient had had nocturnal enuresis every night since birth and had many times been under treatment. At the end of a fortnight there was a total of five dry nights—a thing which had never been known in the girl's life before. Cure was effected in five and a half months and has remained permanent for a year.

The following case demonstrates the benefit of clinic treatment.

CASE IV

Kathleen F. aged 9. The second of four children of professional class parents. No family history of enuresis. Enuresis two or three times during the night and occasionally during the day since birth. The child was seen in private practice and no improvement was made by the end of a month. The mother was not co-operating and was indignant that the child was having no medicine. Consultations continued at a clinic where other children were being treated in the same manner. Cure was effected in three months and has remained permanent for three years.

Analysis of 70 Cases

The series consists of thirty-one boys and thirty-nine girls ranging in age from 4 to 10 years with one of 15 years. The age incidence rises gradually from 4 reaches a peak at 8 (twenty-two cases) and then falls off. In forty-three of the cases (61 per cent) there was nocturnal enuresis only whilst the remaining twenty-seven (39 per cent) complained of both nocturnal and diurnal enuresis.

Family Records.—In only five of the cases (7 per cent) was there a history of enuresis in one or other of the parents while ten of the children (14 per cent) had a brother or sister who suffered or had suffered from the complaint. Fifty-one or almost three quarters of the children came from a family of three or more, ten came from families of two and nine were only children. The ratio of hospital-class patients to private patients in the series was 23 to 1.

Associated Conditions.—Preliminary physical examination brought to light the following conditions: thread worms in twenty-five (35 per cent), enlarged tonsils and adenoids in fifteen (21 per cent), undescended testicle in two (2.8 per cent), malnutrition in four (5.7 per cent), pituitary in one (1.4 per cent).

With regard to the tonsils and adenoids group it should be noted that in only three of the cases was enlargement so gross that they were referred for operation first. The remainder were treated beforehand and only a few of these underwent tonsillectomy at a later date partly because of refusal and partly because the surgeon considered it unnecessary. In two of the cases the enuresis cleared up in hospital following the tonsillectomy without further treatment.

Some attempt was made from the parent's account and from observation to classify the children into three temperamental groups—namely, nervous or excitable,

normal and phlegmatic. It must be admitted, however, that the majority (70 per cent) appeared to fall into the normal group—the nervous and phlegmatic totalling 15 per cent. each—and no great reliance is placed on these figures.

Results of Treatment—Since it is difficult to ascertain at what stage cure may be assumed to be permanent, care has been taken to keep in touch with the majority of cases. For those not heard of for some time a follow up has been undertaken as thoroughly as possible. Out of the whole group forty-two (60 per cent) are known to have maintained their cure for periods ranging from eighteen months to six years, an additional seven (10 per cent) are considered cured, but so far have only maintained their improvement for a few months, seven (10 per cent) are not traced, and fourteen (20 per cent) are failures. There are no improved cases. Either a child can be encouraged to stop his enuresis or he cannot, and the fact that he wets his bed only four nights out of seven instead of every night does not mean that he is very much better off, and the method must be regarded as having failed. In the accompanying table the results are tabulated.

Although two of the failures were in those with low intelligence quotients no attempt was made in the group as a whole to correlate enuresis with intelligence. Addis (1936), however, has brought forward evidence to show that bladder control is not necessarily deficient when intelligence is low, and that enuretics have a smaller percentage of low intelligence quotients than non-enuretics. Addis also disagrees with Batty (1933), who considers faulty training, overcrowding, bad home conditions, and dirt to be among the chief factors in the production of enuresis. On this point it is not possible to arrive at any conclusion from the present series, as no systematic inspection of homes was undertaken. It is interesting to note however, that a greater proportion of private patients were cured than hospital patients (76 per cent as against 54 per cent) and that there was a greater proportion of failures in the hospital class than in the private class (25 per cent against 10 per cent).

Enuresis has also been described as a pure conduct disorder (Hamill, 1929), but there were at least three cases in the present series which cleared up following treatment of definite associated defects alone, though how far the results were due to suggestion it is difficult to say.

70 Cases	Cured 42				Cured but only maintained a few months as yet 7				Not traced 7				Failed 14			
	Hospital Class 26		Private Patients 16		Hospital Class 6		Private Patients 1		Hospital Class 5		Private Patients 2		Hospital Class 12		Private Patients 2	
	Noc turnal	Noc turnal and Diurnal	Noc turnal	Noc turnal and Diurnal	Noc turnal	Noc turnal and Diurnal	Noc turnal	Noc turnal and Diurnal	Noc turnal	Noc turnal and Diurnal	Noc turnal	Noc turnal and Diurnal	Noc turnal	Noc turnal and Diurnal	Noc turnal	Noc turnal and Diurnal
No of cases	17	9	12	4	6	0	1	0	2	3	0	2	5	7	0	2
Average duration of treatment	2½ months	4 months	3 months	4½ months	2½ months	—	3 months	—	—	—	—	—	—	—	—	—
Threadworms found	7	3	5	3	—	—	1	—	—	—	—	1	1	2	—	2
Tonsils and adenoids enlarged	2	—	1	—	2	—	1	—	2	1	—	1	1	2	—	1
Undescended testicle	—	—	1	—	—	—	—	—	—	—	—	—	—	1	—	—
Petit mal and malnutrition	1	—	—	—	—	—	—	—	2	1	—	—	—	1 petit mal	—	—

With regard to the fourteen failures, two of them were in backward children having an intelligence quotient of less than 90 (Binet and Simon, Herring revision), two patients did not return after the first consultation, and in two of the cases the parents failed to co-operate. One suffered from *petit mal* and did not improve with this method until luminal was added. He then remained dry except when he was having frequent attacks of minor epilepsy. A further two cases, heavily infected with threadworms, cleared up when these were successfully treated, and one commenced to improve under this regime only when large tonsils and adenoids had been removed. The remainder four in number, were completely unaltered.

Discussion

With regard to the aetiology of enuresis many hypotheses have been put forward including heredity, nervousness, peripheral irritation as from threadworms, associated abnormalities such as enlarged tonsils and adenoids, epilepsy etc. In this series none of these defects seemed to be entirely responsible in that many of the cases cleared up before attention was paid to them. In a few of them however they did appear to be a factor of importance.

Again, psycho-analytic studies of enuresis have revealed a connexion between it and the emotional life of the patient, in that it is the expression of unconscious erotic fantasies, or fantasies of persecution, love, and hate, though whether this view is generally accepted among psychologists I do not know.

With regard to the different treatments advocated for enuresis they are too numerous to summarize here. They include belladonna, atropine, ephedrine, pituitrin, camphor, re-education, and suggestion by means of injection of inert substances. Goldman and Malavazos (1936) have utilized hormone therapy. Stocks (1936) reports a series of twenty-eight cases in which thirteen were cured and others improved by calcium. But any idea that a specific drug effect may lead to cessation must be considerably modified by the work of Friedell (1927) who cured 87 per cent of functional enuretics by subcutaneous injections of sterile water, and by Usher (1931), who has used similar treatment successfully.

Whatever may be the psychological significance of enuresis, therefore, and however important the coexistent physical defects in initiating or maintaining it, it seems reasonable to regard the failure to outgrow the habit at the normal age as a neural motor reaction in response

to many different environmental situations and bodily states whether emotional, physical or a mixture of the two, and to assume that in no two cases is it due to an identical combination of factors. At all events it is quite possible to persuade most of the children to change the habit by simple encouragement or by other suggestive means, nor is the task very laborious.

Summary

1 A series of seventy cases of enuresis in mentally normal children is described with the procedure by which they were treated.

2 The results of treatment are analysed and show at least 60 per cent of cures maintained over a length of time by the one method and additional cures by other methods to suit the individual case.

3 Theories of aetiology and different methods of treatment are briefly discussed.

4 Most of the cases may be cured by simple procedures based on encouragement or suggestion.

My thanks are due to Dr H C Cameron in charge of the children's department, Guy's Hospital, and to Dr J L Roberts, school medical officer for the City of Portsmouth, for permission to include in this series cases collected from their departments.

ACUTE LYMPHOCYTIC MENINGITIS

BY

WILLIAM HUGHES, MD M.R.C.P.

Acting Physician General Hospital Singapore

Acute lymphocytic meningitis is a specific disease which has been systematically described only in recent years. It is characterized by symptoms of meningitis often preceded by upper respiratory tract infection, certain distinctive findings in the cerebro spinal fluid, and a benign course usually ending in complete recovery.

The modern study of the aetiology of the disease began when Armstrong and Lillie (1934) during the St Louis epidemic of encephalitis in 1933 isolated from a fatal case in a negress a virus which was pathogenic for monkeys and mice. They found that this virus differed in many respects from the virus of encephalitis on which they were working at the time. Later Armstrong and Dickens (1935) showed this virus to be identical with one recovered from a series of cases of acute lymphocytic meningitis. Bengtson and Wooley (1936) reported successful cultivation of the virus on the chorio allantoic membrane and brain of the developing chick. They make the interesting observation that inoculated chicks hatched out were definitely subnormal in many features. Findlay, Alcock, and Stern (1936) isolated a virus from a mouse which had developed symptoms of nervous disease. This virus they showed to be identical with Armstrong's virus, and they further established the identity of the American lymphocytic meningitis with the European type. They were able to demonstrate the presence of antibodies in the blood of a Dublin patient previously reported by Collis (1936), and they give a full account of their studies on two cases in England which they investigated themselves.

They also found antibodies in the blood of a certain proportion of wild mice which suggests that these rodents may form the natural reservoir of the infection. The present position then is that lymphocytic meningitis is known to be widely distributed in Europe and North America. Recently Allen and Spence (1935) have reported six cases from New Zealand. I cannot find any record of cases reported from the Tropics but I propose to describe later on a series of patients who showed all the symptoms of lymphocytic meningitis. This makes it probable that the distribution of the disease is universal.

Pathology

Armstrong and Lillie found that intracerebral inoculation of the virus was usually fatal for mice. The mice die in convulsions after six to eight days. In monkeys the condition is characterized by drowsiness and apathy and recovery is the rule. Findlay, Alcock, and Stern found an intense basal meningitis in their experimental animals. The infiltration extended on to the posterior surface of the upper part of the cord. There was extensive round-celled infiltration in the lining membrane of the whole ventricular system. Armstrong and Lillie found oedema and infiltration of the choroid plexus in two thirds of their specimens. The name chorio-meningitis which is often used to describe the disease, is based on this finding. The lesions are confined for the most part to the meninges and choroid plexus and there is very little perivascular infiltration in the brain tissue.

Symptoms

The clinical symptoms of the disease are hardly sufficient to distinguish it from other forms of meningitis and meninges. It begins often as a cold, sometimes with coryza. Even in the early stages there may be generalized aching. Headache can be intense. One of our cases had a peculiar combination of drowsiness and insomnia. The temperature is raised usually running between 100 and 103 F. Kernig's sign is present in practically all cases.

Armstrong and Dickens say there is usually no paralysis and no definite neurological signs. Allen and Spence however found an occasional extensor plantar reflex in their cases. In one of our cases there were extensor plantar reflexes, weakness of the legs, and retention of urine. Findlay, Alcock, and Stern record paraplegia, praesthesia and cranial nerve palsy in their cases both of which had retention of urine. The cerebro spinal fluid shows characteristic changes. The cells are increased and findings of 50 to 2 000 per cmm are recorded (Armstrong and Dickens). Lymphocytes may constitute up to 100 per cent of the cells and are rarely below 90 per cent. Sugar, chlorides, and urea are normal. No bacteria are found.

Diagnosis

In the Tropics there are special difficulties about the diagnosis of such cases. Apart from diseases like dengue, influenza, and spirochaetosis, ieterohaemorrhagica, which may simulate the condition clinically, there are three comparatively common diseases which give similar cerebro-spinal fluid findings. I refer to tuberculous meningitis, syphilitic meningitis and lead encephalopathy. The important though not the only factors in excluding tubercle are the absence of bacilli, the normal chloride content of the fluid, and the benign outcome of the disease. In the case of syphilis we sometimes have to rely on the Wassermann or other serological reaction. How far these tests are reliable in an individual case it is often

difficult to say. One would expect, however, that the Wassermann or Kahn test would be positive in the spinal fluid in 100 per cent of cases of syphilitic meningitis. Even so one reads of fairly well-authenticated cases of recovery in tuberculous meningitis on the one hand and undoubted cases with normal chlorides and absence of tubercle bacilli on the other hand. In syphilis there can be a 'clinical silence', as Craps (1936) puts it, during bismuth treatment. It is a legitimate speculation that meningitis could occur before the Wassermann reaction became positive again.

Lead encephalopathy can give a picture not unlike that described for acute lymphocytic meningitis, and the cerebrospinal fluid findings are similar, except that the cells are rarely increased to the same extent. In children lead line and paralysis are not to be expected and gross anaemia is rare. Encephalopathy in children and adults due to the use of toilet and face powders containing lead is common, especially among Chinese in the Far East.

Keeping the above considerations in mind, I think it is still possible to report with confidence the occurrence of two cases of lymphocytic meningitis in Malaya. Both were treated in the wards of the General Hospital, Singapore.

Case I

A male European, aged 23, admitted on January 11, 1937, was discharged on January 26. His illness began eleven days before admission with fever, cough and generalized aching. He recovered sufficiently to get up from his bed on the fifth day. On the seventh day the fever returned. He now complained of headache, weakness of the legs and subjective disturbances of sensation—pins and needles. He was put to bed and had to be catheterized on the tenth day. On this day he was said to have coughed up some blood or sputum streaked with blood. On admission to hospital (eleventh day) he looked ill. Prominent symptoms were headache and photophobia and drowsiness with insomnia. The bladder was distended and he was unable to pass urine. Kernig's sign and head retraction were present. Knee jerks were exaggerated, and there was bilateral ankle clonus. The right plantar reflex was extensor, the left normal. Abdominal reflexes were absent. There was no ocular paralysis and the fundi were normal. The lower limbs were weak but there was no gross paralysis and no objective sensory loss. No signs of disease were observed in the chest. Routine examination of blood (for malaria) and stools (for ova), and repeated examination of the sputum (for acid fast bacilli) revealed no abnormality.

Lumbar puncture on January 12 revealed a clear fluid under increased pressure. The count gave 110 cells per cmm, globulin was present. The total protein amounted to 120 mg. and the chlorides to 710 mg. per ccm. Sugar was found. A differential count showed that 85 per cent of the cells were lymphocytes. There were no organisms in stained or unstained smears. The Wassermann and Kahn tests were negative. The lumbar puncture relieved the headache. On the fifth day after admission the patient was able to pass urine and on the sixth day his reflexes were all normal. His temperature which was 101° F on admission fell by lysis to normal on the fifth day and remained so. On January 21 he developed a small swelling at the angle of the mouth. A boil formed which discharged itself on the inner surface of the lower lip after two days. Otherwise his convalescence was rapid and without event.

Case II

A male European, aged 26, admitted on January 28, 1937, was discharged on February 16. On January 27 in the afternoon he suddenly developed severe headache with a temperature of 102° F. His bowels were opened twice that afternoon. The next day he had diarrhoea—six motions. The headache and fever persisted and he was admitted to hospital in the evening. On admission his temperature was 102.6° F and the pulse 100.

He looked ill and was restless. He had nausea and retching and complained of severe headache. The tongue was moist and coated, the fauces were injected. No signs of note in the chest or abdomen. Routine examination and inspection revealed no abnormalities in stool, urine or blood smears. His fever remained at 102° F for two days, after which he ran an irregular temperature varying between 99° and 101° F for the next five days. White blood counts on January 30 and February 1 showed 9,500 and 9,100 cells with 79 per cent and 86 per cent of polymorphs respectively. Stool culture was negative for dysentery and enteric groups as was the blood culture for the enteric group. The Widal reaction was twice negative for *O* agglutinins in enteric *abortus* and *proteus* (X19 and Xk) groups. H agglutinins for enteric were present, but were without significance owing to previous T A B inoculation. On January 30 he complained of severe abdominal pain. There was some general tenderness but no rigidity. The pain continued for the next three days, during

Cerebro-spinal Fluid Findings in Case II

Date	3/2/37	5/2/37	10/2/37
Cells per c.mm	268	116	68
Lymphocytes	93.5%	100%	100%
Polymorphs	6.5%	nil	nil
Total protein	100 mg. °	90 mg. °	80 mg. °
Globulin	Present	Present	Present
Chlorides	703 mg. %	733 mg. %	—

which time his symptoms became aggravated. His restlessness increased and there was that marked alteration in behaviour which is often associated with tuberculous meningitis. Further examination on February 3 revealed head retraction, a positive Kernig's sign on both sides, flexor plantar reflexes sluggish, knee jerks and brisk abdominal reflexes. Lumbar puncture on this date gave a slightly opalescent fluid under increased pressure. There were 268 cells per cmm, of which 93.5 per cent were lymphocytes and 6.5 per cent polymorphs. The sugar content was normal and the protein 100 mg. and chlorides 703 mg. per 100 ccm. Wassermann and Kahn reactions of the fluid were negative. Gram and Ziehl-Neelsen stained smears showed no organisms.

Headache was relieved by lumbar puncture and improvement set in rapidly. Further lumbar punctures were performed on February 5 and 10, the results of which are set out below. On the 9th all his symptoms had disappeared and he was allowed up. His convalescence was rapid and uneventful.

Comment

Birch (1936) who has recently described some cases, gives a good account of the differential diagnosis in temperate climates. In view of what has already been written in regard to diagnosis in the Tropics, elaborate comment on the above cases is unnecessary. In future it is hoped to arrange for biological tests. It should then be possible to decide whether the lymphocytic meningitis which occurs here is identical with that in Europe and in North America.

The fact that in both instances quoted above the patients happened to be Europeans might give a wrong impression of the racial incidence of the disease. Actually they are representative of half a dozen similar cases—Asiatic and European—seen by me in the past two years. My notes in regard to the other cases are not complete and do not justify publication at this stage. I believe the incidence of the disease in Malaya is about the same as it is in Europe and that it affects all races in the Peninsula.

Summary

Two cases of lymphocytic meningitis in Malaya are described. The symptoms were comparatively severe, but

recovery was complete in both cases. Clinically the disease was identical with the acute lymphocytic meningitis of Wallgren.

My thanks are due to Dr Benjamin Chew for the routine investigations and for the blood counts. I am indebted to the Government pathologist, Singapore, and his staff for the Wassermann and Widal tests, and to the Director of Medical Services, Straits Settlements, for permission to publish this article.

BILATERAL TUBAL PREGNANCY

REPORT OF A CASE

by

MURIEL B McILRATH M.B. B.S. Sydney,
 I.R.C.S. Eng., M.C.O.G.

Resident Obstetrical Officer, Withington Hospital, Manchester

Multiple extra uterine pregnancy is a sufficiently unusual condition to merit a report of any case that may be encountered. Such cases may be grouped under the following three headings:

- 1 Intra uterine pregnancy combined with extra uterine gestation
- 2 Multiple pregnancy in a single Fallopian tube
- 3 Coincident pregnancy in each tube

This last group may be subdivided into two groups, (a) successive or repeated gestation as seen in the case of Ferguson (1899), (b) simultaneous binovular gestation as seen in the cases reported by Launay and Seguinot (1911) and Lockyer (1917). The second subdivision of the last group is undoubtedly the rarest form of multiple extra-uterine pregnancy, and it is often extremely difficult to prove that a given case falls into this category.

Case History

The present case is that of a woman aged 28, married nine years, who was admitted to hospital on February 14, 1937. The following are the particulars:

Menstrual History.—Menstruation started when the patient was 15 years old, regular twenty-eight-day interval lasting three to six days, no vaginal discharge. The last menstrual period occurred on December 24, 1936; there had been no loss per vaginam since then.

Previous History.—There had been one normal confinement eight years ago and one miscarriage at six weeks four years later. Three years ago the patient had pains in the lower abdomen with vomiting and constipation. Two months later she had a similar attack, and six months ago another attack in which the pains were less severe but lasted longer.

Present Illness.—At 6 p.m. on February 13, 1937, the patient suddenly felt faint and had slight pain in the lower abdomen shooting upwards. This pain became worse and caused the patient to vomit. She fainted and does not remember the events very clearly. The vomitus was brownish in colour. During the night the pains came on again, starting in the pelvis and shooting up into the abdomen. They were colicky in nature. She felt she was choking and vomited constantly, and on attempting to pass urine she fainted. On the morning of February 14 the pains were still present, and she also

complained of pain in the right shoulder. She was admitted to hospital on February 14 at 2 p.m. On examination the patient appeared shocked and the skin was cold. She was very pale and the tongue brown and dry. Temperature 97.2° F, respirations 22, pulse 120 thin and running. Heart and chest were clear. The abdomen moved evenly on respiration and was not distended; there was no rigidity but marked voluntary guarding. Very tender in right iliac fossa.

On vaginal examination a soft boggy mass was found in the pouch of Douglas and an ill defined soft swelling in the left fornix. The uterus was very tender and voluntary guarding made adequate examination of the right fornix very difficult.

A diagnosis of ruptured tubal gestation was made.

Operation

Under general anaesthesia the abdomen was incised by a mid line infra umbilical incision and free blood escaped on opening the peritoneum. On exploring the pelvis a mass was found on the left side formed by the left tube surrounded by omentum. Through a gap about one centimetre long on its anterior aspect chorionic tissue and old blood clot were seen protruding. Clamps were placed on the uterine end of the tube, the mesosalpinx and the proximal end of the omentum and the tube and adjacent omentum removed. Clots were removed from the pouch of Douglas and haemostasis secured. Then fresh blood was seen to be escaping from the fimbrial end of the right tube in which there was now observed to be a swelling the size of a hazel nut impinging on to the uterus. The right tube was removed. Some difficulty was experienced in checking the bleeding from the uterine cornu. The right ovary was the seat of a corpus luteum of pregnancy but no similar change was seen in the left ovary. Clots were taken from the peritoneal cavity and the abdomen closed. The patient was given a continuous intravenous saline transfusion for three hours and then continuous rectal saline for forty-eight hours. Apart from some difficulty in getting the bowels to act the patient made an uninterrupted recovery and left hospital in three weeks.

Macroscopically both tubes were found to be thin and tortuous. In the left tube on the anterior aspect about three centimetres from the uterus there was a rent one centimetre long through which chorionic villi and old blood clot protruded. The omentum had wrapped itself round the rent but the adhesions were plastic and therefore of quite recent origin. The foetus unfortunately was not found. The attachment of the omentum to the site of rupture recalls the findings of Paul Bloch in the case reported by him (1931) though in his case the attachment was of longer duration. He too found no trace of either foetus. The right tube was unruptured; there was a swelling the size of a hazel nut at the site of foetal implantation. Haemorrhage had occurred around this area and in the lumen of the tube the amniotic sac was ruptured but no sign of a foetus was discovered.

Unfortunately the specimens were thrown away before a microscopical examination was made. Microscopical study was therefore impossible but the macroscopic examination definitely revealed two areas of foetal implantation separated from each other by the fundus of the uterus. On the left side there was definite rupture and on the right evidence of tubal abortion. The foetus was not recovered on either side. There was only one corpus luteum of pregnancy but according to Lockyer (1917) this is the usual finding though in the case reported by Schoekaert (1928) there were two, one in each ovary. Apart from this Schoekaert's macroscopic findings closely resemble those seen here. That this case is not one of hematosalpinx on one side and tubal pregnancy on the other is proved by the presence of chorionic tissue on both sides and absence of distension of the tube in its whole length as was found in Dorn's case (1891).

The attempt to correlate the operative findings with the history is interesting. The first onset of pain was slight but rapidly became worse and was apparently extremely severe. It was accompanied by internal haemorrhage and shock as the patient fainted and was only semi-conscious for several hours. This apparently was caused by the rupture of the

left tube. The patient's condition then improved, but during the night she was seized with colicky pains, evidently the attempt at abortion of the part of the right tube. In both cases she referred the pain to the centre of the lower abdomen. The physical findings were not helpful in aiding the diagnosis of bilateral tubal pregnancy, but in the light of subsequent findings the extreme tenderness on the right side in conjunction with the tumour on the left should have suggested the possibility.

The question of the relative ages of the pregnancies in this case it is impossible to decide. The periods had been regular till six weeks before the onset of the illness, and it is therefore reasonable to assume that both pregnancies were of equal development. Neither foetus was recovered, so help from that source is lacking. Finally, there was only one corpus luteum of pregnancy. It is probable that this was a case of simultaneous bilateral tubal gestation, but further than this it is impossible to go. The aetiology of tubal pregnancy is still *sub judice*. That inflammatory changes are frequent precursors of tubal pregnancy is however, extremely probable, and in this case the history of three previous attacks of lower abdominal pain is very suggestive of salpingitis being at least a predisposing factor.

Finally, with regard to treatment opinions vary. Lockyer (1917) considers that the possession of a normally menstruating uterus is of great importance to the mental outlook of the patient. Launay and Seguinot (1911) consider that in such cases it is often impossible to tell ovary from tube, that both are grossly disorganized and both may need to be removed. They argue then, that the uterus is superfluous when both tubes and ovaries are removed, and a subtotal hysterectomy permits of better toilette of the pelvic cavity and reperitonization of the raw areas. Beckwith Whitehouse (1935) advocates conservation of the ovaries when possible and also of the uterus, unless special circumstances call for its removal. Undoubtedly if the condition is diagnosed before rupture double salpingectomy is sufficient. After rupture, when the patient is suffering from shock and haemorrhage the minimum of surgical intervention necessary to relieve the condition seems indicated, and therefore the author is in favour of double salpingectomy, conserving the ovaries, or at least a portion of the ovaries, whenever possible.

I am indebted to Dr Fitzgerald for permission to operate and report on this case.

A special commission for scientists and doctors and others interested in the relation of science and medicine to peace meeting simultaneously with other commissions on Saturday May 29 will be a feature of this year's National Peace Congress to be held at Friends House Euston Road London from May 28 to 31. The chairman of the commission is Professor S. Chapman, F.R.S. of the Imperial College of Science, and the introductory speech will be made by Professor P. M. S. Blackett, F.R.S. The commission will discuss the development of the contribution of the scientific and medical world to the promotion of international peace. All interested organizations national and local, are entitled to appoint delegates to the congress or to the science commission. Individuals can also attend as visitors. Copies of the programme and full particulars are available from the National Peace Council 39 Victoria Street S.W.1

INTRA-EPIDERMIC VACCINATION

BY

EDWARD R. PEIRCE, M.R.C.S., L.R.C.P.
D.P.H., D.T.M.

Senior Assistant Port Medical Officer Liverpool

The vaccination of a large number of individuals speedily and efficiently is a problem which often confronts the medical officers of port health authorities. For instance, in the event of a case of small-pox occurring in a large passenger liner the number of contacts to be vaccinated may amount to several hundreds, the quantity of lymph at one's disposal may be limited, and it is imperative that the method adopted should be simple, speedy, efficient, economical, and, above all, leave as few ill effects as possible.

Intra-epidermic vaccination, which has been in practice for ten or more years in Canada and the United States and has also been used exclusively by the medical officers of the Liverpool Port Health Authority for the past three years, satisfies all these requirements, and experience has shown it to have many advantages over the scarification method.

It is *simple and speedy* in that it is merely one intra-epidermic puncture not more than a sixteenth of an inch, and in addition is entirely painless.

It is *efficient* since when the lymph is good and the technique correct a specific reaction never fails to appear.

It is *economical*. The avoidance of wastage of lymph is sometimes of paramount importance when the amount is limited. By the intra-epidermic method an efficient vaccination is obtained with a minute drop of lymph so that a tube indicated for one vaccination is sufficient to vaccinate twelve people or even more. As no dressing is required on the arm at the time of vaccination a great saving in gauze or lint, and bandages or strapping is effected. Dressing is only necessary if and when the pustule appears.

Technique

The usual means by which lymph is transferred from the tube to the arm have never been satisfactory, rubber bulbs for fixing on to the end of the lymph tube after the ends have been broken off do not entirely meet the case, as the bulb is too small to give that delicacy of touch which is necessary for the expression of successive and discrete minute quantities of lymph from the tube, while the unhygienic practice of blowing the lymph out of its tube cannot be too strongly deprecated, and may possibly be the cause of secondary infection.

In the transference of minute drops of lymph from the tube to the arm the following procedure has been found to be eminently satisfactory: the only apparatus required is a soft rubber teat as used in a baby's feeding bottle. At least a dozen persons may be vaccinated with one ordinary small tube of lymph and this number can be increased with practice. The glass tube sealed at both ends and containing the lymph, is pushed through the small hole of the teat until about an inch of it is visible (Fig. 1 A). This end (Fig. 1 A) is broken off, and the glass tube drawn back again until about an inch is still left within the teat (Fig. 2). The free end of the lymph tube is then broken off and by means of gentle pressure with the thumb over the open end of the teat successive and discrete minute quantities of lymph can be expressed (Fig. 3). Whereas by the old methods one tube of lymph was used to vaccinate one or perhaps two persons it will be found that by the method just described one small

tube of lymph will be sufficient to vaccinate a dozen or more persons. Particular care must be taken to maintain a steady pressure of the thumb when expelling the lymph from the tube. Any relaxation will cause the lymph to be drawn back into the test and subsequently lost.

If a large number are to be vaccinated at one time it is an advantage to have two medical officers working together and also a nurse or attendant for the purpose of cleaning the arms with spirit. When the arms have been prepared one medical officer goes down the line,

FIG 1

FIG 2

FIG 3

putting the smallest possible amount of lymph on each arm followed by the second medical officer who does the actual vaccinating. In this manner mass vaccination can be carried out speedily and efficiently. The technique is exactly similar to a Schick or a Dick test: a straight solid, sterile needle is held almost parallel with the skin and the point is inserted gently through the drops of lymph under and along the epithelial layer for about a sixteenth of an inch, and immediately withdrawn, by this means a minute quantity of lymph is carried into the layers of the skin on the point of the needle and although so small in amount is sufficient to produce a perfect vaccination, always provided that the individual is not immune. In this way blood is never drawn. It is not necessary to attempt to rub the superfluous lymph into the needle track, and no dressing is required on the arm. The vaccination is inspected after twenty-four hours, and daily afterwards if the exact nature of the reaction is to be recorded. In no case where the technique is correct and the lymph efficient is there failure to react

in one or other of the following forms—namely (a) immune reaction, (b) vaccinoid, (c) successful vaccination.

(a) *Immune Reaction*—If the subject be immune owing either to a previous vaccination or to a previous attack of small pox a faint red spot with slight swelling and some itching will appear over the site of puncture in about twenty-four hours. The reaction reaches its maximum in about forty-eight hours and usually disappears in about four days.

(b) *Vaccinoid*—This is a modified vaccination and appears on either the third or the fourth day in the form of a vesicle or small pustule about a quarter of an inch in diameter. Constitutional reaction is slight and generally unnoticed.

(c) *Successful Vaccination*—No local reaction appears before the fourth day and very occasionally may be delayed until the sixth day. The local and constitutional symptoms correspond with those of an uncontaminated successful vaccination by the scarification method. The absence of any reaction within six days is due either to poor lymph or to faulty technique and in such cases revaccination should be carried out preferably with different lymph and repeated until a reaction is seen.

Advantages of the Method

From observations carried out over a period of two years on vaccinations performed by this method a number of interesting facts have been elicited.

1 It is extremely rare to get severe local or constitutional disturbances. Two ship's companies each consisting of several hundred men were vaccinated one by the intra-epidemic method and the other by the scarification method. The lymph was of the same origin and the surgeons were experienced vaccinators. In the ship's company vaccinated by the former method there were no "bad arms" and none of the crew was off duty, whereas in the latter there were no fewer than 5 per cent who suffered from severe local and general reactions and were off duty for varying periods of from two to five weeks.

2 No dressings are necessary at the time of vaccination.

3 There is a great saving in the amount of lymph used which is an important factor when a large number of vaccinations are performed at one time.

FIG 4

4 There is no necessity to rub in the lymph after the needle has been withdrawn (Fig 4 shows diagrammatically how the operation should be carried out).

5 Many hundreds of intra-epidemic vaccinations have been performed in the Port of Liverpool, and so far there is no history of any case of post-vaccinal encephalitis.

6 There is no trauma arising from the needle puncture and the immune reaction when present is perfectly definite.

This reaction also occurs when the scarification method is used, but is obscured by the trauma

In conclusion there is a tendency on the part of an operator carrying out this method for the first time to think that the small quantity of lymph carried into the layers of the skin on the point of the needle will be inadequate to result in an efficient vaccination, but practical experience will dispel this idea

I am indebted to Dr T Gwynne Maitland medical superintendent of Messrs Cunard White Star Limited for the records of a large number of vaccinations carried out intra-epidermally and to Dr F C Logan medical superintendent of the County Mental Hospital Gloucester for suggesting the method of transferring the lymph from the tube to the arm.

A NOCIFENSOR LESION OF THE HAND

A SYNDROME FOLLOWING TRAUMA AND ASSOCIATED WITH ADDUCTION OF THE SHOULDER

BY

GEOFFREY J LILLIE, F R C S

Assistant Surgeon Princess Elizabeth Orthopaedic Hospital Exeter

During the past two years we have been greatly interested in five patients with peculiar circulatory and sensory disorders of the hand following injury to the upper extremity but not due primarily to injury of the hand itself. Most of us are familiar with cases in which after a direct blow to the carpus with or without fracture a profound circulatory stagnation occurs in the hand with an extreme form of osteoporosis in its skeleton. The present cases are different, however, for as I shall show, the cause of the circulatory disturbance in them is to be found in the shoulder region. I have thought it worth while drawing attention to these cases because a knowledge of the possibilities may enable one to be on guard to prevent them and because I believe an appropriate demonstration is provided of a type of disorder recently described by Sir Thomas Lewis as of the nocifensor system

Symptoms and Signs

All five patients were women between the ages of 40 and 50 who had suffered some trauma to the upper limb between two and four weeks prior to the onset of symptoms in the hand. The original trauma varied—there were two cases of Colles's fracture one of fractured olecranon one of fractured clavicle, and one of traumatic arthritis of the shoulder joint. In four out of five cases the right upper limb had been injured. In every case the arm had been immobilized by the side since the injury. The symptoms complained of were pain in the region of the shoulder-joint, severe constant burning pain in the hand and fingers with increasing stiffness and extreme sensitiveness both to touch and to changes of temperature. The signs were practically constant in each case. There was marked limitation of movement of the shoulder with generalized tenderness around the joint. The patients with a traumatic arthritis of the shoulder-joint and with a fractured clavicle were the only two giving a history of injury in that region.

The skin of the hand and fingers was smooth and shiny. The colour varied from red when warm to blue when cold. There was hyperalgesia to pinprick and hyperaesthesia to light touch over the affected area more marked as one would expect, on the flexor aspect. The

interphalangeal joints were stiff and painful. In the older cases trophic changes were commencing in the nails and the fingers. In short, the general picture was similar to that of causalgia. Further clinical examination revealed several features of interest. In two of the patients the pupil on the same side was larger suggesting some degree of cervical sympathetic irritation. This was supported by the finding of a blood pressure raised by ten millimetres of mercury in the affected arm in three patients, one of whom had an enlarged pupil. Radiograph examination was made of the cervical spine, shoulder, and hand in each patient. One had evidence of the common mild cervical arthritis. No cervical ribs and no bony changes in the shoulder were demonstrated. In two patients there was definite osteoporosis of the bones of the hand. This is a common finding in any hyperaemic condition of long standing.

Outstanding Features

In these five cases there are three outstanding features. First they represent only a fraction of the injuries of the upper limb treated in a similar manner, secondly, they showed evidence of sympathetic stimulation at a high level and, lastly there were peripheral circulatory disturbances of a constant type resulting from injury at various levels. It remains to demonstrate an organic lesion capable of producing these features each of which will be discussed in turn.

There can be no doubt that immobilization of the upper limb and shoulder girdle must tend, especially in middle aged women, to produce not only some drop of the shoulder girdle in relation to the bony thorax, but also some distraction of the humerus from the scapula at a lax joint which is dependent more than any other upon muscle tone. This second factor might well be the cause of the constant periarticular adhesions of the shoulder joint. This downward drag must tend to put the lowest trunk of the brachial plexus on the stretch as it runs over the first rib.

Telford and Stopford, following the work of Todd, have shown by histological studies that the sympathetic connexions of the lowest trunk of the brachial plexus are generally found scattered within the trunk. They drew attention, however to the fact that in a certain number of cases these sympathetic fibres may lie close to the periphery and even form a distinct separate bundle in the inferior part of the trunk that is nearest to the first rib. In such a position the sympathetic fibres are more exposed to the risk of irritation or drag across the rib, and give rise to vascular symptoms. We have considered that such sympathetic irritation with resultant arteriolar spasm, would account for the rise of blood pressure on the affected side in our cases and that drag upon the inferior cervical ganglion or its branches would result in similar irritation and be responsible for the slightly dilated pupil.

In searching for the cause of the peripheral circulatory changes we are upon even less certain ground. For many years the posterior nerve roots were thought to contain fibres concerned only with sensation. Then it was found that if posterior nerve roots or sensory cutaneous nerves were cut and their peripheral ends stimulated flushing of the skin was produced. Sir Thomas Lewis showed that these antidromic impulses in the sensory nerves produced in the skin a substance like histamine which dilated the cutaneous vessels a response favourable to trauma and inflammation. He has recently shown that these impulses are not antidromic but are carried by hitherto unknown efferent fibres travelling to the periphery in the sensory nerves. Stimulation of these fibres produces throughout

the area of the cutaneous nerve in which they run not only a flush but indirectly also hyperalgesia. He is inclined to attribute the pain to the liberation in the skin of a substance which in turn directly stimulates the known pain nerve endings. To this efferent system, which is essentially protective, he has applied the term "nocifensor." He considers that the clinical picture known as causalgia results from stimulation of nocifensor fibres by an irritative lesion of a nerve.

We have already some evidence of sympathetic irritation near the lowest trunk of the brachial plexus. Coincident stimulation of nocifensor fibres in this trunk would account for the vascular changes and hyperalgesia in the hand, the part of the limb which is supplied very largely from this trunk.

Treatment

The treatment has aimed at the elimination of this source of irritation. In each patient the shoulder joint was manipulated under anaesthesia in two or three stages to stretch periarticular adhesions. After each manipulation in abduction splint was used, accompanied by treatment with radiant heat massage and exercises to the shoulder and hand. In every case the colour changes and hyperalgesia in the hand improved rapidly. The raised blood pressure and dilated pupil became equal within a fortnight. The pain and stiffness in the shoulder resolved next, but the complete return of movements in the fingers has been tardy.

The relative infrequency of these cases would not appear to justify the universal use of abduction splints in arm injuries, but the study of such cases indicates the need for special watchfulness in middle-aged women with injuries to any part of the upper extremity, the early mobilization of their shoulder-joints so as to prevent adhesions and brachial plexus drag. Should such lesions develop the treatment by manipulations, abduction and physical therapy offers a good chance of cure but demands considerable patience on both sides.

I am indebted to Mr. Norman Capener for permission to report these cases and for his interest and help in preparing this report.

The fourteenth issue of the *Proceedings of the University of Otago Medical School* is dedicated to Sir Lindo Ferguson. This tribute marks Sir Lindo's retirement from the post of Dean of the Medical School which he has held since 1914. He was the first trained ophthalmic surgeon to settle in New Zealand, whither he emigrated in 1883 for reasons of health. During his tenure of the office of dean two important measures were carried through largely by his efforts: the extension of the medical curriculum from five to six years and the transfer of the departments of anatomy and physiology from the main University to fresh buildings adjoining the new Medical School. Besides tributes to Sir Lindo Ferguson the issue contains among other interesting articles papers on hydatid disease and gonorrhoea, the two principal causes of medical research in New Zealand. In view of the mortality from hydatid disease in that country estimated at roughly 15 per cent, septicaemia is regarded as the commonest cause of death. The hydatid has recently been introduced by the Australian College of Tropical Medicine and analysis of this condition in the hospital of 1936 is case record already published. With regard to gonorrhoea, the results of a series of 1000 examinations of men in certain parts of New Zealand and in the Islands of Samoa give a picture of the prevalence of gonorrhoea in the predominant

Clinical Memoranda

A Case of Bronchostaxis

In view of the recent article in the *British Medical Journal* (January 16, p. 109) on bronchoscopic findings in some cases of haemoptysis, the following case is of interest, as it emphasizes the position of bronchoscopy in unexplained haemoptysis.

CASE REPORT

A man aged 48 years was admitted to St. Nicholas Hospital complaining of having coughed up about a cupful of light red frothy blood. The patient, on direct questioning, stated that he had lost some weight during the past eight months and had had a slight cough for six months. He had also had a fair amount of worry during this time. There were occasional vague pains in the chest and some shortness of breath on exertion but no other symptoms. There was no family history of any chest trouble.

On examination the patient was seen to be a healthy looking man with a somewhat anxious expression. The mucous membranes were of good colour. His dental condition was good, and there was no bleeding from the gums; the throat was healthy. No cardiac enlargement was detected by clinical examination or by x-rays. The heart sounds were natural and there were no added sounds. The vessels appeared to be healthy. The blood pressure was 130/80. With regard to the respiratory system the chest was found to be symmetrical, both infrascapular regions were a little flat but the tone of the pectoral muscles was good. The right upper zone appeared to move a trifle less than the left. The percussion note appeared normal. On auscultation the breath sounds were slightly weaker over the right upper zone. They were vesicular and there were no added sounds. The trachea was in the mid line. There was no clubbing of the fingers. No abnormality was detected in the digestive and the central nervous systems.

The patient continued to cough up bright red frothy blood for three days after admission. There was no pyrexia. On investigation the sputum was repeatedly found negative for tubercle bacilli and the Wassermann and Kahn reactions also were negative. Radiographs showed that the heart was not enlarged. Those taken of the lungs revealed a condition of the left apex which the radiologist described as an old healed lesion. There was no evidence of neoplasm. Lipiodol examination showed no evidence of bronchiectasis.

The haemoptysis did not recur, but it was felt that in view of the possibility of a small bronchial neoplasm and the above negative findings a bronchoscopy was indicated. The patient was anxious to know his position and gladly accepted the advice. He was accordingly transferred to St. Giles Hospital for bronchoscopy by Mr. Cawthorne (ear, nose and throat consultant surgeon to the London County Council) to whom I am indebted for the following report:

"*Right side*—A reddish patch of mucosa about the size of a sixpenny piece in the main bronchial wall just distal to the opening of the upper lobe bronchus. This bled on touching. The middle and lower bronchi were normal. *Left side*—Normal. *Summary*—A bleeding patch on the right bronchus rather similar to the condition of the nasal mucosa in epistaxis."

CONCLUSION

A case of bronchostaxis is described, and the value of bronchoscopy is emphasized as a means of establishing the diagnosis in cases of haemoptysis and also in this case of relieving the anxiety of the patient.

I am indebted to Dr. P. Hamill, consulting physician to the London County Council Medical Services, for his advice; to Dr. J. de C. consulting radiologist to the London County Council for the radiological findings; and also to Sir Frederick Menzies, Medical Officer of Health, London County Council, for permission to publish.

JOHN C. ROBERTS, M.B., B.S.

St. Nicholas Hospital, Farnham.

Recurrent Perforation of a Gastric Ulcer

The following case is sufficiently rare to warrant recording. It does not tend to bear out the contention of W J Mayo, Clairmont, and other surgeons, who drew attention to the fact that complete perforation by the cautery, through the centre of the crater of an ulcer, had been made an essential in technique because of a clinical finding that spontaneous and complete perforation of a gastric ulcer is quite likely to be followed by the cure of the ulcer and of the patient, providing the resulting scar does not encroach on the pylorus.

CASE REPORT

An unmarried man of 24 had been a ship's cook for about a year. His meals were always irregular. For two months before admission to hospital he had suffered from "wind and had a bad taste in the mouth." In September 1933 at the age of 21 he had had two or three glasses of beer, and was sitting down when an acute attack of abdominal pain bowled him right over and he vomited. Classical physical signs of perforation were present.

At the first operation a small perforated gastric ulcer, low down on the lesser curve, was found and over sewn. As there was little exudate the abdomen was not drained and recovery was uneventful.

He remained well after operation and received advice as regards diet and the taking of a bismuth powder. He was told that he should return for further investigation. He gave up his work as ship's cook and became a stevedore, his meals being then a little less irregular. Ten days before admission for the second operation he began to suffer from a dull aching pain in the epigastrium. This lasted up to four hours and was unrelated to the taking of food. In April 1935 at the age of 23 he was walking along the road one and a half hours after tea when he was seized with an attack of acute abdominal pain, as in 1933 which doubled him up. The physical signs were like those accompanying the first perforation.

At the second operation a perforated ulcer was found in the same situation as on the previous occasion. It was embedded, and the abdomen was drained. Recovery was uneventful.

He had no symptoms subsequently until a fortnight before the third admission, when gnawing pains in the epigastrium began to trouble him. They would last most of the day and were unrelated to meals. In January 1937, at the age of 25 while walking he was again seized with acute pain in the abdomen similar to that in the previous attacks. The characteristic physical signs were again present.

At the third operation a small lesser curve perforation was found once more covered by adhesions which sealed it off from the general peritoneal cavity. The perforation was embedded and the abdomen closed without drainage there being very little exudate. He is progressing very favourably.

The patient is healthy looking and well developed. He had always enjoyed good health other than just before each operation. He has been adhering to a prescribed diet as much as possible, and has taken bismuth powder regularly. He is of moderate habits. The family history was irrelevant.

This case presents the following points of interest: (1) the age of the patient, (2) three recurrent perforations, (3) each perforation appeared to be in the same situation, (4) the comparative absence of symptoms.

I am indebted to Mr Russell Howard M.S. F.R.C.S., for allowing me to publish this case.

Reviews

DISEASES OF THE GALL-BLADDER AND BILE DUCTS

La Vésicule Biliaire et ses Voies d'Excrétion By M. Chiray and I. Pavel. Second edition (Pp. 860. 203 figures. 120 fr.) Paris: Masson et Cie. 1936.

This work by Professor M. Chiray of Paris and Dr I. Pavel of Bucarest, with an account by Dr A. Lomon of the radiology of the extrahepatic biliary tract which occupies more than a hundred pages, including thirteen pages of references must be the most exhaustive volume yet published on the subject. In 1927 the authors brought out a monograph on the gall bladder, reviewed in these columns (1928, 1, 265), and now it has been expanded by the inclusion of the extrahepatic bile ducts and numerous additions throughout, the number of pages and illustrations being increased by a fourth and the price raised, but still comparatively cheap. The authors have segregated the biliary tract from the liver. In the first of the five parts the anatomy and physiology are, as before, summarized so as to bear on the clinical manifestations of disease. Thus the vexed question of the amount of power of contraction possessed by the thin walled gall bladder is discussed in some detail, and experimental and clinical observations made by the authors and others, are brought forward to support the conclusion that the main function of the gall bladder is to serve as a reservoir with the power of active contraction. Later in the section on biliary colic the pain is ascribed to contraction of the gall-bladder, which depends on a sensitive state of the neuro-vegetative nervous system. The functional interrelations of the gall bladder and Oddi's sphincter at the lower end of the common bile duct are said to have been elucidated in 1893 by Doyon in a scientific thesis at Lyons before the well known work of Meltzer and Vincent Lyon. The authors attach great importance to the non-surgical drainage of the biliary tract in disease as practised by Vincent Lyon of Philadelphia.

In this valuable source of reference due attention is drawn to the work done by English speaking writers in North America and this country. The bibliographies are most complete, and the illustrations good.

A SANITARY CLASSIC

Reid's Practical Sanitation. Revised and rewritten by John J. Buchan M.D. D.P.H. Twenty third edition (Pp. 332. 84 figures. 3 plates. 7s. 6d. net.) London: C. Griffin and Co. 1937.

Dr George Reid's handbook for sanitary inspectors, which now reaches its twenty third edition may justly be accounted a classic in the subject with which it deals. For forty four years it has worthily held the field of practical sanitation, adjusting itself in successive issues to the altering circumstances of the time. In view of the lamented death of its original author, and of the rapid progress and extensive new legislation of recent years the occasion has been deemed fitting for a complete recast of the book the charge being entrusted to the competent hands of Dr J. J. Buchan.

The new edition adequately covers the principal divisions of environmental sanitation—namely water supply, ventilation, drainage, house construction, disinfection and food control. The useful digest of sanitary law takes

in the recent Housing Act of 1936, the Public Health Act of 1936, and important statutes of earlier date relating to food and other matters. Among articles of practical interest are those on the taking of water samples, surveys of household drainage and the protection of woodwork in houses. Special attention has been properly directed to the disposal of refuse by controlled tipping, which at present enjoys a wide vogue. Full instructions are given for the management of tips in such a manner as to avoid offence. Bug destruction, another problem of the day, is suitably presented. What is said on milk and milk production, including cowsheds, the dairy milk grades, safe milk, and pasteurization, is admirably expressed in little space—a merit which is equally evident in the ensuing article on meat.

Dr Buchan writes out of wide experience and with a vigorous pen. His book is cordially recommended to all interested in sanitation.

TECHNIQUE OF IONIZATION

The Practice of Ionization. By J Newton Dyson M.R.C.S. L.R.C.P. (Pp. 178. 9 figures. 6s. net.) London: H. Kimpton, 1936.

Until he is actually qualified and in practice a medical student may not realize how small a part of what he has studied has to do with the practical management and treatment of patients. On a given disease his mind may be stored with information about aetiology, pathology, and morbid anatomy, but in practice he may find that all this seems to be of no avail if he has no constructive answer to the patient's primary question, 'But what can you do for me?' For this reason Dr J Newton Dyson's small book will come as a boon to those whose training has given them no knowledge of the value of some of the simpler methods of electrical treatment, since it provides practical information that will enable the physician to carry-out useful treatments with relatively simple equipment in a variety of conditions.

Dr Dyson's descriptions of technique are clear and uncomplicated, so much so that in some cases—for example, in the particularly interesting chapter on special organs—they may make the reader underestimate the amount of experience and skill needed for special treatments. In nearly all the treatments described the author attributes the beneficial results to the effect of the constant current itself because of its ability to "galvanize" into activity tissues which seem to hang fire in the process of healing and, in more localized applications, to its sclerolytic action on abnormal tissue. He uses the term ionization in its literal sense, implying the movement of ions in the tissues and not the introduction of chemical ions from without. In support of the view that chemical ions cannot be introduced through the skin by the constant current, the author quotes Murray Levick's experiment in which a leg about to be amputated was ionized with sodium salicylate immediately before amputation, and immediately after amputation careful analysis revealed no trace of the sodium salicylate. It may be argued that a leg about to be amputated is not in its normal state and is not a good subject for ionization. Against the author's view can be quoted the well known experiment in which rabbits are killed rapidly when connected in a constant current circuit if potassium cyanide or strychnine ions are applied under the appropriate electrode. It has recently been observed in the treatment of climacteric arthritis that when histamine is applied under a pad on the knee the patient's face and neck become flushed after the current has been running for some time.

Although in most treatments Dr Dyson relies on the constant current alone for the purpose in view, he uses a solution of zinc for its sterilizing effect in the treatment of ulcers, sinuses, and suppurative conditions of the nose and middle ear. In these cases the zinc ions do not penetrate into the tissues, but unite with the albumin, forming a superficial layer of zinc albuminate. This occurs only when the zinc ions are liberated by the current, and not when zinc is merely applied as a solution.

Perhaps the chapters on special treatments will prove of the greatest interest to those whose training has been lacking in experience of the value of physical methods of treatment. In some cases the author's enthusiasm allows him to make statements that savour a little of popular medicine—for instance, in connexion with Graves's disease, where he speaks of 'strengthening the nerves which were suffering from the absorption of excessive thyroid secretion'. In those cases of deafness which were greatly improved by ionization the inclusion of more detailed case notes would have been of advantage.

Treatment by ionization has often been in disrepute owing to unsubstantiated claims by its advocates and in writing of its effects it is therefore advisable to be over-cautious rather than sanguine. It is perhaps unwise of the author to cite the use of ionization in rodent ulcer and in lupus; any treatment which delays the application of the Finsen-Lomholt lamp combined with general carbon arc irradiation, in a case of lupus, is not wise.

THE AIM AND SPIRIT OF SCIENCE

What Science Stands For. By Sir John Boyd Orr F.R.S. Professor A. V. Hill F.R.S. Professor J. C. Philip F.R.S. Sir A. Daniel Hall K.C.B. F.R.S. and Professor Lancelot Hogben F.R.S. (Pp. 132. 5s. net.) London: G. Allen and Unwin, 1937.

In this small book are reprinted a number of papers read last year at the Blackpool meeting of the British Association, with a broadcast by Professor A. V. Hill on 'The Humanity of Science'. Taking the definition of humanity as 'the quality or condition of being human' Professor Hill asserts that the scientist at work is a human being like the rest of us, citing Sir Joseph Barcroft as an ideal example. But with reference to the acquired meaning of humanity, connoting kindness or benevolence, there is a natural tendency to regard the creative agent of poison gas and bombing aeroplanes as inhuman. Professor Hill, however, logically points out that science can scarcely be blamed for the misuse which non-scientific people make of certain scientific discoveries. Of those ultimately responsible for such misuse whether dictators, Prime Ministers or even Members of Parliament, only an insignificant minority have any acquaintance with science. Professor Hill gives a striking instance of the humanity of the scientific world. At an International Congress of Physiology at Edinburgh shortly after the war an attempt was made from abroad to exclude the Germans. Thereupon the British physiologists refused to attend unless the Germans were invited. The Germans came, and friendly scientific relations were restored. Professor Hill concludes with the words 'May not the example of science, with its spirit of friendly co-operation, lead gradually to a more reasonable view of international relationships, and so make its greatest contribution of all to human welfare?'

Sir John Boyd Orr, in a paper on 'Nutritional Science and State Planning' envisages as a dietetic goal the production of a higher standard of health than the mere absence of obvious disease. "For public health purposes

the standard which should be adopted is a state of physical well-being which cannot be improved by any change in the diet. Anything below that level should be regarded as malnutrition. Meanwhile the consumption of protective foods is hopelessly inadequate among the poorer classes, indeed, in nearly half the population the diet is below standard. Nor is the present supply of fruit, vegetables, and animal products in this country sufficient to provide for the proper dietetic demands. Increased production and lower retail prices are required. The land, the money, and the knowledge are available. The necessary financial aid provided by the State would secure as dividends improved national health, agricultural prosperity, and a stimulus to trade. A national food policy on these lines would constitute the greatest social reform of our age."

Professor J. C. Philip deals with 'The Chemist in the Service of the Community'. Apart from the important role of chemistry in fundamental research, the application of this branch of science to industrial problems confers many benefits on the public. The purification of a water supply, the isolation of a vitamin, the production of petrol from coal, of creaseless cotton fabric or non-inflammable film, are striking examples of applied chemistry. The remainder of the book is devoted to papers on 'Cultural and Social Values of Science' by Sir Richard Gregory, Editor of *Nature* on 'Knowledge and Power' by Sir Daniel Hall, and on 'Naturalistic Studies in the Education of the Citizen' by Professor Lancelot Hogben.

STATISTICAL METHODS

Statistical Methods in Biology, Medicine and Psychology By C. B. Davenport and Merle P. Ekas. Fourth edition (Pp. 216. 13s. 6d. net.) New York: John Wiley and Sons. London: Chapman and Hall, 1936.

To the middle aged or slightly elderly statistician the new edition of Davenport's—now Davenport and Ekas's—*Statistical Methods* recalls and invites comparison with the past. The first edition appeared in 1899, before the word biometry had come into general use, but when Karl Pearson and W. F. R. Weldon had already some enthusiastic helpers in their attempt to persuade biologists to count and measure. The second edition, published in 1904, was virtually a working handbook of methods devised by Francis Galton, Karl Pearson, W. F. R. Weldon, and their associates, and the full title, *Statistical Methods with Special Reference to Biological Variation* accurately described its scope—namely, that of a practical handbook of methods for the biological laboratory or museum worker.

The present, fourth, edition is entitled *Statistical Methods in Biology, Medicine and Psychology*. The general plan is, indeed, the same as that of thirty-two years ago. The volume is not a critical textbook, but a series of brief descriptions—illustrated by worked examples—of statistical methods in general use, followed by a collection of tables needed in computation. In number of pages this edition does not much exceed that of 1904, but the contents are widely different. The literature of the subject is now so large that the list of references is shorter than that of 1904, because an exhaustive bibliography could not have been printed. A handbook of biometric methods can no longer be simply a summary of Karl Pearson's papers: some methods he approved are obsolete, others he did not favour have been found valuable. But it is a significant fact that of the items in the select bibliography more than a quarter are works of Pearson or his pupils. One might almost use Macaulay's hyperbole

'Turn where we may, the trophies of that mighty intellect are full in view. We are judging Manlius in sight of the Capitol.'

To the earlier generation "Davenport" was a most valuable book, it could be put in one's pocket, and, as the tables included a table of logarithms, one could make shift to do statistical work with its help alone—as the reviewer discovered when on active service. Workers of to-day are more luxurious, and methods more complex. A beginner might find 'Davenport and Ekas' too concise to keep him from error. But to the trained statistician it will be a valuable pocket-book. If he takes it, and "Chambers, into the country he will be able to do some work without a calculating machine."

Notes on Books

How Animals Behave the seventh volume of the 'Science of Life' series by H. G. Wells, Julian Huxley and G. P. Wells forms the bridge between the six earlier volumes dealing with biology in general and the two concluding volumes devoted exclusively to man. It is published by Cassell at 4s. The authors state that two only of the various streams of evolving animal life have attained outstanding success—the vertebrates and the arthropods. Each represents a different line of mental development, the former developing intelligence, the latter relying upon instinct. Even in the co-operative communities of insects which store food and have a real economic life all behaviour is shown to be based upon the power of automatically performing unlearned actions. Anatomical considerations have limited the size of the insect's brain. With regard to vertebrates instances are given of the inferior brain power of the lower branch of mammalian stock—the marsupials. For example, the Tasmanian devil and the marsupial wolf are almost untameable, in contrast to the placental wolf, which has been tamed into the domestic dog. The final chapter, devoted to monkeys and apes, concludes with a speculation regarding the result of fifty generations of selective breeding for intelligence of chimpanzees. They are so near the critical point at which language and abstract thought begin, could one help them across it?

The *Proceedings of the Second International Congress for Microbiology* held in London in 1936, have been published under the editorship of Dr. R. S. R. Joiner Brooks. The papers, which cover a wide range, are given in abstract only. The president states in the preface that the Executive Committee decided that this method of publication should be adopted in the belief that full publication of communications to international congresses was no longer called for. The abstracts are supplied by the authors and appear in English, French or German. The volume is worthy of perusal by all medical men and four of its eight sections which include such subjects as virus diseases, pathogenic streptococci, bacteriology of milk, blood groups, and immunization are of special interest.

The first volume of the forty-seventh series of *Internal Clinics* (Philadelphia: Montreal and London: J. B. Lippincott Company) 4 vols. quarterly 50s. the set) contains nineteen articles dealing with renal diseases, hyperthyroidism and thyroid deficiency, respiratory diseases, cardiovascular diseases, the teeth as an aetiological factor in disease, chronic alcoholism as a neurosis, acute meningitis following sinus infection, the purpose and scope of diagnosis and recent advances in carbohydrate metabolism. The papers calling for special attention are those on the nephrotic syndrome in adults by Drs. Eugene M. Landis and Kendall A. Elsom of the University of Pennsylvania, on therapeutic hyperthyroidism by

Dr Israel Bram director of the Institute for the Study of Goiter, Upland Pennsylvania, on lobar pneumonia by Dr L C Montgomery physician to the Montreal General Hospital on carbon dioxide in the treatment of circulatory disorders by Dr Walter S Maclellan medical director of the Sanatoga Spa, New York and on the basis of prognosis and treatment in hypertensive disease, by Dr Robert Wilce dean and professor of medicine, Medical College of South Carolina

Diabetes A Modern Manual by Dr ANTHONY M SINDONI jun (McGraw-Hill Publishing Co 8s 6d) will not help the English doctor in charge of a diabetic patient nor, we feel the diabetic himself. Many good primers on diabetes have been written in America, but we cannot think that this is a valuable contribution. At first the Socratic method of question and answer is adopted to educate the ignorant patient. The other sections are concerned with What to Know and What to Do, and cover the same ground without any great clarity or added usefulness. There are many errors and little clear information. Few will approve of the advice to give insulin fifteen minutes after a meal instead of before. This is based on an idea contrary to accepted knowledge, that insulin acts appreciably from the moment it is injected and that carbohydrate food is slower in being absorbed. The arguments advanced for this (the only

new idea in the book) are so muddled and contradictory (pp 102, 103) as to demand revision on the author's part.

The little work on clinical observation *Der Klinische Blick* (Vienna Julius Springer RM 4 80 paper RM 6 30 bound), which Dr ERWIN RISAK has dedicated to his teachers, Franz Chvostek and Hans Eppinger, is divided into three parts, devoted respectively to the doctor, the sick room, and the patient. In the first part he shows how much the practitioner can learn about the patient by the use of his unaided senses of vision, hearing, smell, touch, and taste. The nature of the sick room in the patient's own home as distinct from the hospital ward may throw some light on the disease especially in tuberculosis, rheumatism, malnutrition, psittacosis, and diabetes. The third part which forms the bulk of the work, shows the information that can be derived without instrumental or laboratory examinations from a study of the patient's temperament, position in bed, sex, age, size, weight, skin, hair, fat, blood vessels, lymphatic glands, muscles, bones, vertebral column, hands, feet, eyes, and ears.

The Art and Craft of Loch Fishing by H P HENZELL is published by Philip Allan at 10s 6d. Many books have been written on trout fishing in general, but few on the specialized branch of loch fishing. The author has succeeded in making his subject interesting and instructive. He gives a list of centres and hotels.

Preparations and Appliances

AN ADENOID CURETTE

Dr M O ABDEEN (Alexandria) writes

In using the ordinary adenoid curettes there are usually two drawbacks: (1) the mucous membrane of the nasopharynx is scraped when the adenotome is used vigorously with the result that bleeding or non bleeding tags are left

to keep it away from the mucosa of the nasopharynx and pharynx, even with vigorous use of the adenotome the upper edge is level with the sides so as to crush the adenoid bed while it is shaved and to minimize bleeding a shallow notch in this upper edge allows the cutting edge to be raised

behind at the time of the operation and scar tissue formation follows. (2) the uppermost part of the adenoid is sometimes left behind. In order to avoid these two defects I have devised the adenotome illustrated. The cutting edge of the blade is raised one millimetre from the sides of the curette

to remove the uppermost part of the adenoid, the lateral notch facilitates the opening of the box.

This curette was satisfactorily made for me by Messrs Mayer and Phelps 59-61 New Cavendish Street, London, W1.

NEW TONSIL SNARE

Mr GEOFFREY H BATEMAN F.R.C.S. (London W) writes

Messrs Mayer and Phelps of 59-61 New Cavendish Street, W1, have made up for me a new tonsil snare. Previously

comes these difficulties. It has considerable leverage and the finger part of the grip is movable in relation to the end of the snare. One is thus able to cut smoothly against considerable

I have used the Eve snare but this model has several disadvantages particularly for operating under local anaesthesia. There is no leverage so that considerable strength has to be used to close it against resistance and it is almost impossible to do this without pulling on the patient's throat a painful proceeding under local anaesthesia and secondly one has to get one's arm very high to use it with the patient sitting up. I therefore looked for a snare with leverage and a grip action. The Tyding snare is of this type but its disadvantage is that the finger part of the handle is fixed in relation to the point of the snare and therefore in closing it one moves the end of the snare and pulls on the pharynx. The new snare over

resistance without effort or jerk. The wire loop is passed over the tonsil and the loop shortened by pushing forward the barrel until resistance is felt, then the tonsil is cut off by several movements of the handle.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY MAY 22 1937

THE HUMAN NEEDS OF LABOUR

To most readers interested in social problems the name of Mr Seebohm Rowntree recalls an important educational experience, for his study of the poor in York was their first introduction to the scientific investigation of a social evil. Charles Booth's great work was too long for the ordinary medical student to tackle, Mr. Rowntree's book was of manageable size and excited both painful and pleasurable feelings. It was painful for the ordinary middle-class youth to realize how terrible were the conditions of many fellow-citizens, it was pleasant to realize that the problem could be accurately enunciated and studied by methods not too difficult for the general reader to follow. Those who had Mr Rowntree for their first teacher are now middle aged, they, and perhaps their sons and daughters, will learn much from his latest book.

In *The Human Needs of Labour*¹ he has followed essentially the plan which informed the research of thirty-six years ago. This book is rather more statistical and rather less dramatic than the earlier one, but the guiding principle is the same. Mr Rowntree has deduced from the work of specialists in various fields the minimum requirements in food, drink, shelter, clothing, and those "luxuries," hardly to be distinguished from human necessities, which must be provided in a community of civilized people. He has worked out the cost of this minimum standard and set out the results. But, unlike many writers, he does not do sums *in vacuo*. With the help of, say, the British Medical Association's reports on nutrition and diets—which Mr Rowntree has found of great value to him—a few Blue Books, a calculating machine, and patience, a much less experienced investigator than Mr Rowntree could produce costings for families of different sizes. Indeed, given a little more patience and a few more Blue Books, one could price the needs of the whole of the families of the nation. But under the existing conditions of economic life these calculations are of theoretical rather than practical importance.

What Mr Rowntree has tried to discover is the effect of fixing a minimum wage, payable to all employed persons irrespective of their individual

family requirements. He set himself the following problem. Given the actual distribution of families of different sizes in York, when the inquiry is limited to families the mothers of which were at the time of inquiry 40 to 45 years old, assuming that up to the age of 14 years children are not earners, and assuming the minimal requirements of individuals to be known, then, working through the data on various flat rates of wage, what proportions of the children in these families would have been living for one or more years below the minimum? The arithmetical solution of this problem is indeed a heroic piece of labour. Mr Rowntree has found the solution. These are the kind of results which emerge. If our flat rate were based upon the minimal needs of families with two children, then 63.6 per cent of the children of the population of fathers receiving this flat rate would for a shorter or longer period be inadequately provided for and 58.8 per cent would be in this condition for five years or more. If three children are reckoned these percentages become 42 and 34.5, even with five children reckoned the figures are 10.4 and 4.5. "In view of these facts," writes Mr Rowntree, "it will, I think, be clear that any suggestion that minimum wages should be based on a standard providing for less than three children per family, as some authorities have recommended, is entirely ruled out of court."

The reader should be quite clear what Mr Rowntree has done. He has not calculated what would be adequate for a population at a future date, when, according to some, families of more than two children will be curiosities. He has taken the gross amounts required for families of different sizes actually in existence, allocated the particular amount to every family in his sample, and then worked out how many children would go short on each flat rate. This is an investigation of fundamental importance. It is of course open to criticisms of two kinds. Methodologically considered it is retrospective. It deals with a batch of families in existence at the date of the census of 1931 and almost complete, without paying too much attention to prophets, it is fair to believe that the census of 1941 would reveal a smaller proportion of large families in a sample taken in precisely the same way. Again it is possible that a York sample is not fully representative of the family structure of the country as a whole. These are questions of statistical method. Material criticisms might be directed to the determination of standards. Some might hold them to be too high, many more would think them too low. Mr Rowntree discusses these points quite judiciously and his arguments must be left to the reader's judgement. He concludes that

a minimum weekly wage of fifty-three shillings in towns, perhaps rather more in great cities, and of forty one shillings in the country are, at 1936 prices, necessary "I know," he writes, "it will be impossible in all trades to insist on such wages at a Trade Board's first meeting. Industry must have a breathing-space in which to adapt itself to fresh conditions. This, indeed, constitutes the argument for fixing wages by a number of Trade Boards rather than by the enactment by Parliament of a flat rate. But a definite limit must be set to the breathing-space. Doubtless sweeping changes must take place in many industries before they can conform to the new policy, but if it is inflexible, these changes will be made. Industry after all exists for citizenship, not citizenship for industry."

It is something of an anticlimax to say this is an important book. That should already be obvious. Without, however, entering into detail which would cover many pages, it is impossible to say more.

A PHYSICIAN'S SURVEY

Osler in one of his charming lay sermons to doctors recommends that the individual should at not too frequent intervals—he suggests the recurring anniversary of the birthday as appropriate—devote a short time to reviewing his attainments, determining how far they have fallen short of the aspirations with which he set out, and what circumstances have contributed to this default, so that if possible these may be avoided in future. Having thus as it were come to the surface for a breath and look round, he is advised to set a course more closely in the direction of his ideals and then to dive into work again without too much heart-burning. It is proper, too, that from time to time a leader of the profession should direct our thoughts to a survey of the scope of our work, the aims of our profession, the relationship of the profession to the community, the services we owe the community and the reciprocal advantages we may expect in return. Such a survey is offered by Dr R. A. Young in the annual oration he delivered before the Medical Society of London, published elsewhere in this issue of the *Journal*. Approaching the subject as an artist Dr Young briefly sketches the development of graphic art from the primitive line-drawing of the savage or school child to the finished pictures of the supreme artists, and shows how two great secondary factors are added in these to the accuracy of line—namely, perspective and poise or balance. Dr Young then proceeds to apply the analogy to the problems of

present-day medicine, using the term perspective in a sense removed from the original notion of a science of optics—namely, the proportion in which the parts of a subject are viewed by the mind.

In some respects the advance of medicine appears to have turned a corner in this generation. The workers of the early nineteenth century received from their predecessors a few clear descriptions of clinical entities which we now regard as classical, and many so disproportionate as to be rather caricatures. The work of morbid anatomists, and later of physiologists, and later still of biochemists, of the last fifty to eighty years has added details and shading sometimes increasing the definition, often blurring the pictures. It has remained for recent times to look less at the disease entity, or rather to envisage it in terms of its relation to the diseased body, as Dr Young says, "to discover and to study the causes of disease and the nature of the disturbances of function in the sick—in effect, the third dimension of the disease." We have thus advanced from the position advocated by Osler, or rather his advice wants restatement. He recommended an immersion in work, which in another sermon he described as the master-word in medicine. In his own activities, however, though paying lip service to work, he was led by his genius to use a balanced judgement, to work, as the old artist mixed his paints, "with brains, Sir." No amount of labour can bring about advances unless the isolated facts are associated in a working hypothesis, which can be tested by further observations and which shows the lacunae that still need to be filled in. Viewing the subject as a whole we may be led to discriminate between essentials and non-essentials. Dr Young suggests that this action of getting the perspective, getting the facts of diagnosis and prognosis not only in their relative position but in their relative proportion, is an essential function of the trained physician, and is to be borne in mind in the preparation and training of medical students.

The more enlightened social sense of to-day demands that the patient should be regarded not only as a diseased person, but as a possibly disease-bearing person among his fellow-workers and the community. Potentially infective patients are treated from the more general point of view, as well as receiving individual care. It is especially in the psychological aspect of disease that new views are developing—the psychological additions to physical disease, the care for the surroundings of the sick man and the control of the environment in which he is being treated so that as far as possible every hindrance to his progress may be

removed. More attention is paid also to the stresses and anxieties of the modern rush and speed of work in their deleterious effects on the nervous system and on resistance to disease. This enlargement of the field of medicine has brought changes in two directions, changes which readily lead to fallacies and false doctrine unless watched. The theories or hypotheses may, on the one hand, with imaginative workers far exceed the legitimate inferences from the facts observed, may indeed become fantastic, leading to useless and harmful methods of treatment. On the other hand, the increased lay interest in the general aspects of disease is often followed by impatience at the apparent slowness of real progress, and a tendency to pursue brilliant but unsubstantiated generalizations. Members of the medical profession must therefore be aware of these psychological repercussions on their work. They must be prepared to test, to accept and incorporate in their armamentarium methods that are useful though unusual, to discard those that are harmful though fashionable. They must further be prepared to guide and safeguard the people as a whole by counsel in private practice and in public concerns. There may be difficulties in performing this double duty, but modern conditions of social life demand that these difficulties should be fairly faced by scientific medicine. Science may never be dogmatic but the art of medicine consists in applying science to the alleviation of the sick and the benefit of the community, and there is need for clarity of vision and balanced judgement.

TECHNIQUE OF SYMPATHECTOMY

Since its introduction as a therapeutic measure two unexpected facts have emerged with regard to the vascular effects of sympathectomy. First, the full vasomotor relaxation which occurs immediately after sympathectomy is transient the vessels regaining a considerable tone five to ten days after operation, secondly, the improvement produced by ganglionectomy in vascular maladies such as Raynaud's disease appears to be more striking in the lower than in the upper extremities. Two independent series of observations on the experimental animal have sought to explain these facts and the results may have important bearing on the choice of operation in man. R. T. Grant with Camp, Graybiel and Rothschild¹ has shown that the regain of vascular tone which takes place in the rabbit's ear during the first few days after sympathectomy is accompanied by an increased reactivity of the denervated vessels to such substances as adrenaline, histamine and pituitrin. The denervated ear also becomes paler and cooler during exercise—a vasoconstriction attributed to the release into the circulation of a chemical substance

which comes from neither the adrenals nor the pituitary, since the ear still pales with exercise after these organs have been removed. It was also found that the enhanced responsiveness to adrenaline is less after pre- than after post ganglionic section and the authors accordingly suggest that "if the phenomena of the regain of tone are the same in man as in the rabbit then it would seem that when operative measures are undertaken for the relief of peripheral vascular disease preganglionic section is preferable to postganglionic section." Rather similar observations have recently been published by White, Okelbury, and Whitelaw.² While they differ from Grant in attributing to the release of adrenaline the vasoconstriction occurring in the denervated ear during exercise finding this almost abolished by removal of one and denervation of the other adrenal these workers also observe that the sensitivity of denervated vessels to adrenaline is greater after post than after pre ganglionic section. They find that in man adrenaline produces a much greater constriction in the sympathectomized finger than in the sympathectomized toe, and attribute the more satisfactory therapeutic results obtained in the lower extremity to the preservation of the postganglionic fibres to the leg in the ordinary operation of removing the second and third lumbar sympathetic ganglia in the familiar operation for the upper extremity in which the inferior cervical and first and second dorsal ganglia are removed the postganglionic fibres degenerate. Acting on this suggestion, Smithwick has lately introduced an operation in which the sympathetic supply to the upper extremity is interrupted but the postganglionic fibres do not degenerate. The operation consists in cutting the sympathetic chain below the third dorsal ganglion and resecting the proximal 2 cm. of the first and second dorsal nerves. A less drastic operation has been recommended in this country by Telford³ who crushes and divides the sympathetic cord below the third dorsal ganglion and divides the white rami from the second and third dorsal nerves. Smithwick's operation is said to lead in Raynaud's disease to much more striking improvement than does ganglionectomy, Telford also points out that the disfiguring enophthalmos and contracted pupil resulting from ganglionectomy do not arise after preganglionic section. At present then there are strong suggestions that preganglionic section is the operation of choice in peripheral vascular disease but final judgement must be withheld until the method has had more extended trial and until it is known to what extent the sympathetic fibres regenerate after this less drastic intervention.

THE RENAISSANCE OF OTOTOLOGY

In his presidential address to the Section of Otology of the Royal Society of Medicine at the opening of the present session Mr. Douglas Guthrie took as his subject "The Renaissance of Otology." Mr. Guthrie justifies his use of the term "renaissance" because there was in otology dating far back to the sixteenth century as the familiar names of Eustachius, Valsalva and Fallopius

¹ *Arch. Neurol. Psychiat.* Chicago 1936 38 1251
² *Brit. J. Surg.* 1935 23 448

suffice to show but he takes as his heroes Toynbee Hinton and Wilde, who transformed otology into a serious branch of medical practice. The first and greatest of these three was Toynbee, who adopted the study of aural pathology at a time when the practice of otology was largely in the hands of quacks, and his pathological researches have formed the foundation of all later advances in both pathology and surgery. Hinton followed him and elaborated his work and occupied after him the same home in Savile Row, where subsequently Dalby and finally Arthur Cheate lived. Hinton was a mystic and philosopher as well as an otologist, and exercised less influence than Toynbee but his beautifully illustrated book is a permanent contribution to the clinical side. Sir William Wilde, the father of Oscar, practised in Dublin. His contribution was on the clinical side also, and in his book on aural surgery he gives vivid clinical descriptions but much of it is devoted to controversy expressed in the forcible style peculiar to his period. Mr Guthrie relates also many other details throwing light on the otology of the first half of the nineteenth century, but his short sketches of the lives and work of these three men fill most of the paper, which makes a delightful historical document. It is proper to add that this paper was given to the Otological Section and not to the Historical Section of the Royal Society of Medicine and it seems right that the history of the various branches of medicine should form part of such study if their philosophy is to be appreciated fully as well as their practice followed with enlightenment. The Historical Section might flourish more if it were able to maintain a closer contact with the other Sections especially in the matter of publications instead of allowing the history of medicine to be regarded as a detached and isolated study. The address by Mr Guthrie is superior both in material and presentation to much that is offered to the Section of the History of Medicine and is a powerful argument for co-operation.

PINK DISEASE

The increased interest in pink disease shown in this country since the appearance of the masterly account of its principal features by A. J. Wood and I. Wood¹ is paralleled in France by a series of communications from which it seems clear that there was an outbreak of the disorder in 1934 and 1935. E. Leenhardt and J. Boucomont give an account of special investigations of forty-nine patients seen at Montpellier. Lumbar puncture in uncomplicated cases revealed a clear fluid and an absence of any constant change. No abnormalities were found in the blood or in electrocardiograms. The capillarscope however showed early dilatation of the capillary loops with a normal speed for the circulation within these loops and it is claimed that these observations together with others make capillaroscopic examination a definite method of distinguishing pink disease from acrocyanosis. C. Beutter² records observations of 127 cases of pink disease in the region

of the Loire of which 102 were examined by himself, during 1934 and 1935. There was a seasonal incidence during March, April, May and June. Males and females were equally affected. Although there is a general impression in this part of France that the disease is commoner in country districts in the series reported the incidence was equal between country and town. The altitude at which the children had lived made no difference. Discussing the possible infective nature of the condition Beutter cites the case of a child of 2 years who had been for several months in hospital with vague digestive symptoms and developed pink disease two months after being in contact with an infant suffering from an infectious form of this malady. M. Lamy and Madame Proskourakoff,³ of Grenoble from observation of fifty-two cases note a rather increased incidence from April to October and suggest that the disease "incubates" during the winter, lack of sunshine perhaps being a contributory factor. They therefore use ultra-violet light in treatment and also prescribe a sedative of the barbiturate series. L. Barre,⁴ reporting thirty-two cases of pink disease from Avignon and its neighbourhood again emphasizes the increased number of cases seen in the late winter and early spring; these cases appeared over a period of two years, were mild in type, and apparently not infectious. One patient severely affected with mutilation of the hands died of bronchopneumonia. Treatment appeared to make very little difference though it is admitted that the ultra-violet therapy was inadequately applied as most of the patients were isolated in small villages. Pink disease in a European child born in Nairobi and apparently the first case to be reported from Kenya has been recently described by R. W. Bowles.⁵

TREATMENT OF TRACHOMA

It is regarded almost as an act of ancestral piety for a writer on the treatment of trachoma to mention that copper has been used from time immemorial, and that no modern treatment has succeeded in displacing it. Even to some of the initiated copper and the treatment of trachoma appear to be inseparable. That this is not the case is apparent from a paper read by M. A. H. Attiah and A. F. El-Tobgy to the Ophthalmological Society of Egypt. They have little enthusiasm either for the parenteral administration of copper or for such things as tracholysin, adenolysin, protein shock, Jacobson's solution, injections of foreign blood, autoserotherapy, and vaccine therapy. These attempts at general treatment would seem to have no theoretical basis and to give no results in practice. With these views most ophthalmologists experienced in the treatment of trachoma will be in agreement. There is much in this condition that tempts us to look for a general underlying factor and the failure to establish a clear local pathology is an additional temptation to take a wider view. None the less we are on firmer ground in re-

garding trachoma as a local affection. Certainly the results of local remedies are alone worth considering. Perhaps the first step in the management of a case of trachoma is to appreciate the varying clinical pictures and the different responses to treatment that the affection gives in its various phases. The newer methods of treatment cover a wide range. Of the metallic preparations, gold in the form of the sodium salt of aurothio-benzimidiazolcarbonic acid, marketed under the name of triphal, has been of some value, especially in pannus. Copper itself, which is to be used cautiously in the presence of corneal lesions, is applied as a paint in a concentration of 5 per cent. This appears to be more successful than the various proprietary preparations of copper salts that have been produced. Tragynol, an ointment containing copper and chaulmoogra oil, is a possible exception and is said to be useful in cases of papillary hypertrophy. Chaulmoogra oil, though at first its value was doubted by many, seems to be gaining favour, while hydnoceol, a combination of another vegetable oil with creosote, may also have its use, especially in superinfections. Physiotherapy on the whole has proved disappointing, but Attiah and Tobgy report that electric heat has favourable effects on pannus. Surgical treatment along the lines of the classical Heisrath and Kuhnt operation periodically finds new advocates, among whom is Martin Cohen¹ of New York. This plethora of methods points plainly to an unsatisfactory state of affairs, and is eloquent testimony against the belief that copper is the be-all and end-all in the treatment of trachoma, which at its best is still a tedious business. But the application of a saturated solution of quinine bisulphate as a paint in the follicular stage, as advocated by Selinger,² and painting with a 1 per cent solution of perchloride of mercury in the stage of freedom from follicles, which precedes active scarring, give results that are satisfactory in most cases. The value of copper when its use is restricted to the stage in which scarring is actively proceeding is undoubted, but the abuse of this valuable agent must be held responsible for much damage.

PNEUMONIA DUE TO FRIEDLANDER'S BACILLUS

The demonstration that the common cause of lobar pneumonia was a diplococcus and not the capsulated Gram-negative bacillus previously described by Friedländer led many to disregard the aetiological importance of the latter organism and to look upon it merely as a secondary invader. And although from time to time evidence has since been advanced to show that Friedländer's bacillus plays a primary part in a definite though limited proportion of pneumonias, quite a number of workers remain doubtful of the truth of this. This view finds expression in a paper published by Baehr, Schwartzman and Greenspan in 1933.³ These authors believe that Friedländer's bacillus is concerned primarily with infections of the biliary system, the genito-urinary tract, or perforating lesions of the in-

testine, and they suggest that its presence in the lungs in pneumonia is in many instances due to pre-agonal or post-mortem invasion of the blood stream with this organism from the intestinal tract. In a recent paper Solomon⁴ disputes this point of view, and reasserts the primary importance of Friedländer's bacillus in some cases of pneumonia. He describes thirty-two cases which occurred in a series of 5,000 cases of pneumonia at the Bellevue Hospital, which gives an incidence of 0.6 per cent. In nearly all these thirty-two cases (exact number not stated) Friedländer's bacillus was isolated from the sputum or juice obtained by lung puncture early in the disease. Blood cultures were made in twenty-seven of these cases and in nineteen a positive finding obtained, although unlike pneumococcal pneumonia the bacteraemia was mild or minimal. It is important to note that in seven cases Friedländer's bacillus was isolated from the sputum—an observation confirmed by lung puncture in four—from one to eight days before it was isolated from the blood, and that in six other cases it was isolated from the sputum or lung juice or both, whereas blood cultures remained sterile. As Solomon points out, these facts are certainly not in keeping with the view that this organism reaches the lung as the result of agonal invasion of the blood stream. Furthermore, in only two of these thirty-two pneumonias was any other organism associated with Friedländer's bacillus, and even here the evidence suggested that it was playing a primary part. In one patient *B. friedländeri* alone was isolated from the sputum and the blood early in the disease; the associated organisms (pneumococcus Type I and *Streptococcus viridans*) appearing later, and in the other case the associated organism was a Group IV pneumococcus, which was readily separated from the pneumobacilli present in the sputum by mouse inoculation; the latter organism alone appearing in the heart's blood. It must be admitted that Solomon makes out a strong case for Friedländer's bacillus as the primary causal agent in some cases of croupous pneumonia, and it would be of interest to know whether similar cases occur in this country. He draws attention to certain clinical features of these cases—such as the less regular, low-grade pyrexia, the rareness of herpes, the characters of the sputum (brick-red homogeneous emulsion of blood and mucus like red chocolate pudding) which serve to mark off Friedländer pneumonias from those due to the pneumococcus. The consolidation was lobar in the majority—84 per cent of these cases—and where typing of the organism present was resorted to it was found to belong to Julianelle's Type A. Recovery took place in only one of these thirty-two cases, and in five of them specific antiserum was used without apparent effect on the course of the disease.

Dr Edwin Bramwell will deliver the Croonian Lectures before the Royal College of Physicians at London on May 25, 27, and June 1 at 5 p.m. His subject is *Clinical Reflections upon Muscles, Movements, and the Motor Path*.

INFLUENZA AND INDUSTRY

BY

W BLOOD, M R C S

Medical Officer J Lyons and Co Ltd

The following is a report of the influenza epidemic of December, 1936, and January, 1937, as it affected the employees of a large London works

When in December, 1936 it was realized that influenza was assuming epidemic proportions among the employees of a large London works it was felt that a detailed inquiry might yield useful information. To this end records were kept and a questionnaire was submitted to all employees. The works in question seemed a very suitable ground for such an inquiry as it consists of a series of modern factories and offices. The working conditions are good, and in most ways the general conditions, from a hygienic standpoint, may be said to approach the ideal. There are between 6,000 and 7,000 workers of various ages and occupations, and both sexes are represented.

Objects of the Investigation

The investigation was made from two aspects (1) general, (2) local

(1) *General*—To compile statistical evidence of the damage done to the health of wage-earners and of the derangement of industry due to epidemics of influenza, to determine the rate of incidence and the influence of sex, age, and occupation, to attempt to find out whether travel by public conveyance to and from work affected

FIG 1

the incidence. Also it was hoped to be able to indicate whether or no these epidemics attack first of all the wage-earner and secondly, his family at home and whether the chief spread of the infection takes place at work.

(2) *Local*—To provide the company with figures relating to incidence and loss of time, and to consider certain factors possibly connected with the duration of the illness. Finally, to review the effect of working conditions, and whether or not they influence incidence.

For the purpose of this inquiry influenza was considered to be of epidemic proportions from December 1, 1936 to January 31, 1937. The investigation was carried out by a combination of (a) personal observations

and records, (b) questionnaires. The latter were utilized in order to gather information which otherwise it would have been impossible to obtain. Questionnaires to the number of 6,374 were issued, all of which were completed and returned. Twenty of the forms had to be destroyed for various reasons. The remaining 6,354 were included in this inquiry and were made up of question forms from 3,944 men and 2,410 women and girls.

The work performed by these people covers most trades and occupations, but classification may be made under five categories: (i) factory operatives, 2,103, (ii) clerical, 1,517, (iii) distribution, 1,157, (iv) engineers, 1,100, (v)

FIG 2

transport, 477. The age distribution of the staff in ten year periods, together with sex and numbers, is shown in Figs 1 and 2. It will be noticed that the description 'ten-year periods' in connexion with the age distribution charts is not strictly true, since the first group is of necessity 14-20. In each case the black lines in the charts indicate the number of employees whose ages fall between the figures immediately below and to either side of it.

Questionnaires

The questions asked of those employees who contracted influenza in December, 1936, or January, 1937, were

- 1 Name
- 2 Age
- 3 Sex
- 4 Department
- 5 Married or single
- 6 Did you contract influenza in December, 1936 or January 1937? (State which month)
- 7 How long were you ill? (Unable to attend work)
- 8 Did you have any complications?
- 9 Have you had influenza before?
- 10 How do you get to or from work? (Train, bus, tube, walk, etc.)
- 11 Were you the first of your family to contract influenza this time?

The questions asked of those employees who did not contract influenza in December 1936 or January, 1937, were Nos 1, 2, and 10 only. These were utilized for control purposes.

The chief results of the investigation are shown in the tables. The enormous damage done to the health of the wage-earners of the country by epidemics of influenza (if this study is representative of what happened in works all over the country, and it is believed that it is) is demonstrated by the fact that during two months 1,214

people out of a total number of 6,354—that is, 19.1 per cent—contracted influenza. The combined total period of incapacity of these 1,214 sufferers was 12,882 days.

Table showing Results of the Investigation

	Men	Women	Total
1 Total number of employees	3,944	2,410	6,354
2. Number of employees who contracted influenza in two months	653	561	1,214
3 Total duration of illness (in days)	6,758	6,124	12,882
4 The average duration of illness (in days)	10.3	10.9	10.6
5 The average duration of the illness of 154 married women—when calculated separately (in days)	—	12	—
6 Incidence	16.5	23.2	19.1
7 Cases that have had previous attacks	49%	42%	—
8 Cases that were the first or only ones in the family to contract influenza	74%	71%	—

Incidence

(A) *Sex in Relation to Incidence*—Women and girls at these works had an incidence rate of 23.2 per cent., whilst for men the figure was 16.5 per cent. It appears that in this epidemic females were more susceptible than males.

(B) *Age in Relation to Incidence of Both Males and Females* (Fig. 3)—It was found that the highest incidence

FIG. 3

rate for both sexes was between the ages of 14 and 20 years. The percentages were calculated by comparing the number of persons of the same sex in the same age group who contracted influenza with the total number of employees of that sex in that particular age group. In the case of females an abrupt descent from a rate of 22.8 per cent between the ages of 30 and 40 years to 15.4 per cent between the ages of 40 and 50 is witnessed, thereafter the rate rises to 21.2 per cent between the ages of 50 and 60 years. The 50-60 class of female represents only a small proportion of the total female sufferers and the curve obtained possibly does not truly state the case as deductions from small numbers are often misleading.

(C) *Incidence Rate as between Two Classes of Female Workers*—This was investigated, and showed that 197 female members of the office staff out of a total of 902 (21.8 per cent) and 237 female factory hands out of a total of 836 (28.3 per cent) contracted influenza. This

somewhat unexpected result (since office workers are commonly said to contract this infection with greater facility than any other class) is possibly to be explained by such factors as poorer home and sleeping conditions of the factory girls. A further point of difference between these classes of worker is that nearly 50 per cent of the factory girls are married, whilst the vast majority of the office workers are single. Married women factory hands have serious domestic and economic problems to contend with. Do these difficulties so lower the resistance of this class of employee that a higher incidence rate of infection results? The experience of the approved societies in relation to married women workers would appear to favour this suggestion.

The incidence rate in relation to four classes of male workers was investigated, with the following result:

	Case Rate
Engineers	15 per cent
Out-of-door workers	15.9
Office workers	17.7
Factory hands	19.6

It is often stated that out-of-door workers are less susceptible to influenza than indoor workers. The above figures support this belief, except those in the case of engineers. It should be mentioned that as a rule engineers are paid by the hour and get no sick pay, but in this instance about 50 per cent of this class of worker do receive sick pay. The higher rate of the factory hands is possibly due to economic reasons combined with lesser knowledge of hygienic principles.

The average duration of the illness as between four classes of male workers was studied, with the following results:

	No. of Cases	
Engineers	165	9.9 days per person
Office workers	66	10.1
Factory workers	168	10.9
Out-of-door workers	122	11.5

This small analysis was made as an experiment, and it should only be surveyed as such, since much depends on such factors as age, gravity of the infection, and complications, but it was surprising to find that engineers again hold the premier position. With regard to the out of door workers, possibly a higher degree of physical fitness is required before returning to work than in the other classes.

Of the 653 males affected in this epidemic 49 per cent stated that they had had previous attacks and of the 561 women 42 per cent had suffered from influenza before. Many of these people have had several attacks. It was found that in this study 74 per cent of the males and 71 per cent of the females who contracted influenza were the first or only ones of their respective families to contract the complaint. The suggestion is that it is the 'wage earners' who are the first to be infected and that the chief place of spread is at the works or office. This idea is supported by the fact that it was repeatedly noticed during the course of the epidemic that in some departments or offices the great majority of cases occurred in December 1936 (up to 90 per cent of the infected), whilst in other departments or offices a similar thing happened in January 1937.

Mode of Travel

It was found that of a total of 6,354 employees 4,345 travelled by public conveyance to and from work. The remaining 2,009 did not. Of the 4,345 users of public conveyances 860 (19.7 per cent) contracted influenza. Of the 2,009 non users of public conveyances 354 (17.6 per

NOTES OF THE WEEK

Public Medical Service in Norfolk

The West Norfolk Division has prepared a Public Medical Service for its area. Subscription rates have been assessed on the following scale

For a family of one subscriber	6d a week.
" " two subscribers	9d "
" " three	10d "
" " four or more subscribers	11d. "

All eligible members of the household may join the service and any additional adult dependent relative other than a parent or child, who is a member of the household may join at the rate of 4d a week. Each subscriber pays 6d for his contribution card, which is renewed annually. Before subscriptions are distributed among the members each quarter certain percentages, to be decided by the committee from time to time, will be deducted for general administrative expenses and for the formation of a mileage pool to be divided annually among members in proportion to the number of subscribers resident more than three miles from the members' homes. The committee will consist of a chairman, honorary treasurer, honorary secretary and six other members of the service. Provision is made in the rules for procedure in relation to the transfer of practices, the remuneration of non-co-operating practitioners, the expulsion of members, and for the reference of any dispute to the secretary of the Medical Defence Union as arbitrator.

Swansea Medical Service

The annual report of the Swansea Medical Service for the year ended March 25, 1937 shows a satisfactory state of affairs. This service started in 1912, but at that time it was based on the poundage system which is common in parts of South Wales. It is interesting to note that it did not receive the approval of the Association when it began because it did not appear that the subscription rates were sufficient to ensure an adequate capitation fee to the doctors. The present scheme has of course received the approval of the Association and at the last

Public Medical Services Conference two of the Swansea representatives were elected to the Public Medical Services Subcommittee.

The Swansea Medical Service now constitutes the only form of contract practice in the area and there are thirty-nine practitioners associating with the scheme. The number of persons at risk through the Service has increased during the year from 14,890 to 15,770. A particularly interesting feature is the low administrative cost, 91.5 per cent of the amounts collected being paid to the medical practitioners associated with the scheme. By careful and efficient management arrears and lapses are maintained at an insignificant figure.

Colonial Medical Service

The Colonial Office has reprinted in a pamphlet, *Miscellaneous 475*, extracts from a series of articles which appeared in the *Crown Colonist* during August, September and October 1936, on the unification of the Colonial Service. The pamphlet relates briefly the events which led to the first decisive steps in 1930 to inaugurate a single Colonial Service within which special services, such as medicine, education, agriculture, etc., should be unified. In July 1932, the Secretary of State for the Colonies created a Colonial Administrative Service, the first service to which the new principle of appointment on the basis of a schedule of posts was applied. The Colonial Legal Service followed in 1933, and the unified *Colonial Medical Service* in January, 1934. Since that date a number of other services have been unified. The latter part of the pamphlet discusses the question of the standardization of conditions of service, and describes the measures which have already been taken in connexion with salary scales, pensions, widows and orphans' pensions, and leave and passages.

Owing to the great increase in the number of fracture cases dealt with in the casualty department of the Royal Northern Hospital, the board of management of the hospital is to consider the provision of a fracture clinic in which more systematic treatment would be available.

MEDICAL DEFENCE

In 1883 two Dulwich practitioners, Dr Bower and Dr Keates, attended a child who was suffering from diphtheria. The child died, and its father contracted the disease owing it was alleged, to his execution of the instructions given to him by the doctors in the treatment of the child. The two practitioners were prosecuted, first for negligence and then for manslaughter. Both charges failed, but the expenses of the doctors for the two trials amounted to over £1,000. Their plight aroused deep sympathy and concern among medical men, and, at the suggestion of a meeting called by Sir William Jenner, the profession raised by subscriptions a sum of over £1,100, and presented it to Drs Bower and Keates to cover their costs. The case demonstrated the urgent need of organized assistance for practitioners involved in legal difficulties arising from the conduct of their practice, and to it can be traced the origin of what we now know as individual medical defence.

The first attempt to provide a scheme of legal aid was made by seven laymen, who, having observed the disturbance in the profession, registered in 1885 a company limited by guarantee under the title of the Medical Defence Union and appointed a number of legal representatives and local councils in the provinces. It was from a meeting of the local council at Birmingham, when Mr Lawson Tait acted as chairman, that the Medical Defence Union as we know it to-day originated, for the Midland Branch which was then formed gained control of the whole organization, and the conduct of the new Union was soon gathered entirely into the hands of medical men. After many vicissitudes, the Union moved its headquarters from Birmingham to London, and by 1891, owing largely to the tenacity of purpose of one or two of its leaders, it had won an established position in the profession.

The foundation in 1892 of the other great English organization for medical defence, the London and Counties Medical Protection Society represented a secession of certain members from the Medical Defence Union in consequence of the reorganization of the Union in the previous year, but in the course of time the two societies have arranged a scheme of co-operation which, while providing for the members of each society the maximum security, preserves to each its independence and individuality. The profession in Scotland has formed its own society, the Medical and Dental Defence Union of Scotland, on principles somewhat similar to those of the English organizations.

The B.M.A. and Medical Defence

While the societies specially formed for the provision of individual medical defence have become an indispensable part of professional organization it has been suggested on a number of occasions that the B.M.A. should include in its benefits of membership insurance against legal risks. Although on each occasion the proposal has finally been rejected, a brief survey of the action taken by the Council will show that the desires of members have not lightly been dismissed. The first movement which was a proposal for a medical defence fund formed and administered in connexion with the B.M.A., came from the East Anglian Branch in 1886 when the Bower and Keates case was still fresh in mind. Later in the same year a meeting was convened by the Lancashire

and Cheshire Branch of members of the Association interested in the subject, and a committee was appointed to submit the views of the conference to the Council. The Council expressed its general sympathy with the idea of a medical defence association conducted under the aegis of the B.M.A., and proceeded to consider the matter in detail. Its legal advisers, however, were of the opinion that such an undertaking would be *ultra vires* and the proposal was rejected.

The subject was revived in 1894 by the East Sussex Branch, and in the following year by the London Branch. The Council on this occasion considered the alteration of the Memorandum and Articles of Association with the object of securing power to provide individual medical defence and in order that the Annual General Meeting might be in a position to appreciate the nature of the proposals, it prepared a draft scheme of medical defence. The scheme, which was voluntary and to be available only to members of the Branches, provided for an annual subsidy from the ordinary revenue of the Association for the assistance of medical men in respect of proceedings instituted against them, but not indemnity for damages incurred by them. In the event, after the scheme had been altered from a voluntary to a compulsory one, and after a referendum of all the members in this country had been taken, it was decided that the proportion of one-third which had expressed itself in favour of the provision of medical defence, was too small to justify further steps being taken to effect such a drastic alteration in the organization of the Association.

Those members who were still eager for the provision of medical defence by the Association hoped that the reorganization of the constitution in 1903 would afford an opportunity of attaining their object. A committee was indeed appointed to consider the question, but the Association's legal advisers were of the opinion that the Court had not the power to sanction the alteration of the Memorandum in order to permit the Association to undertake individual medical defence as opposed to medical defence work in cases in which general professional interests were involved. They suggested, however, that an alternative to the contemplated alteration of the Memorandum was an application for a Royal Charter. This suggestion was adopted and during the following years the question of medical defence became merged in the wider one of the further reconstitution of the Association through the medium of a Royal Charter. The application for the Charter however was rejected by the Privy Council in consequence of opposition both internal and external.

Except for some minor discussion at the time of the passing of the first National Health Insurance Act the subject of medical defence was not revived until 1921 when a verdict was given against Dr Wood Hill, who was not a member of a defence society, and who suffered a loss of about £2,000 in damages and costs. Once more the provision of individual medical defence by the Association was demanded by a section of the profession, and every aspect of the matter—legal, financial, and practical—was given prolonged and thorough consideration. The deliberations on this occasion included a conference with representatives of the defence societies for the purpose of suggesting to them, as an alternative to the provision of medical defence by the Association the conferment of special privileges on members of the B.M.A. who became members of one or other of the societies. This suggestion proved unacceptable to the societies, and in 1925 the Council recommended to the Representative Body that

the former should be authorized to prepare a draft scheme of medical defence on the basis of an annual subscription of £1, which should be available to those members who desired to take advantage of it, and to ascertain the number of members who would be prepared to join in its membership. The result of a long discussion at the A R M was the rejection of the Council's recommendation in favour of a motion expressing the view that the Association could not expect to conduct medical defence in a better or cheaper manner than the existing defence societies, and that, as the provision of individual medical defence was not within the present powers of the Association, the expense of the proposed referendum of the profession should not be incurred. The accepted motion concluded with an instruction to the Council that it should bring to the notice of all practitioners, especially those recently qualified, the urgent necessity of joining a defence society, and this resolution still governs the Association's procedure on the subject of medical defence.

Benefits Offered by Medical Defence Societies

So real is the risk of legal attack, and so obvious are the advantages of insurance with a medical defence society, that persuasion should not be necessary. Yet several thousands of practitioners in this country have failed to protect themselves. One of the first steps that a medical practitioner should take after he has qualified is to become a member of a medical defence society, and he should remain a member throughout his professional career for however careful and however skilful he may be he cannot expect to be immune from attack. Neither can he be certain that in the event of prosecution he will be able to refute, during the course of the action, charges of negligence or malpraxis. It must be remembered that, although the traditional fairness of British law governs the proceedings, the jury, upon whose verdict the practitioner's fate depends, are laymen, and that no medical expert or assessor sits with the judge. It has therefore sometimes happened that apparently in consequence of the jury's inability fully to appreciate the medical issues involved, the verdict has inflicted, in the general view of the profession, an injustice upon the practitioner. In the case of Claydon v Wood-Hill mentioned above, for example, and again more recently in Tyndall v Alcock, heavy damages were awarded against practitioners whose methods of treatment in the particular case were such as were approved by leading members of the profession. If the practitioner attacked is uninsured, the damages may cripple him financially for a long time and even if he wins his case the costs of it may inflict difficulties from which he may not easily recover.

The benefits offered by the defence societies are very wide and very cheap. In return for an entrance fee of 10s., which is waived in the case of a practitioner applying for membership within one year of registration, and an annual subscription of £1 a member receives benefits which include indemnity against the cost of defending or conducting an action undertaken by the society on his behalf, and unlimited indemnity, subject to the Articles of Association of the society, against damages or costs that may be awarded against him in such a case. The benefits of the Medical and Dental Defence Union of Scotland are defined as an insurance of £2,500, and the payment of a plaintiff's costs in a claim for liability in respect of professional negligence. Not all disputes reach the courts and the member will find that the long experience and wisdom of his defence society are invaluable to him in all sorts of personal legal difficulties. Moreover the very

fact of his membership may save him from the worry of an action in court for it is sometimes found that a patient who, in his first reaction of disappointment or indignation at the practitioner's failure to effect a cure, hastens to institute proceedings, withdraws his accusations when he learns that the practitioner is being supported by the financial resources and the legal experience of a medical defence society.

The extent to which practitioners find it necessary to invoke the aid of the societies may be illustrated by some figures from the last annual report of the Medical Defence Union, which has a membership of over 19,000. During the year 129 cases, some of which involved more than one member, were dealt with by the Union's solicitors. These cases are subdivided under the following headings: libel and slander cases prosecuted or defended 10, malpraxis cases defended, 64, prosecution of unqualified persons, 8, arbitrations and personal matters, 47. The average cost to the Union of the defence of its members in the five heaviest cases conducted during the year was £572 4s 1d. These solicitor's cases were, of course, in addition to numerous requests for help or advice dealt with by the secretary. The total expenditure during the year amounted to £18,245 16s 5d.

Any practitioner who considers the subject seriously must inevitably come to the conclusion that he cannot afford to remain unprotected in respect of his liability to legal attack. This applies not only to private practitioners but to practitioners in all branches of the profession, and even to retired practitioners. As has recently been pointed out, medical staffs in hospitals both voluntary and municipal are open to special risks and local authorities are not responsible for the negligence of their medical officers in a professional capacity. The medical defence societies have also called attention to the position of retired doctors, who are still liable to attack for misdeeds alleged to have been committed while they were in practice. Emphasis is laid on the fact that while the Statute of Limitations may be a good defence for an action brought more than six years after the event, considerable expense may be incurred before the time arrives to plead the Statute.

Practitioners Over-seas

Practitioners practising over-seas run the same risk as practitioners in this country, but although in some of the Dominions schemes of medical defence exist, for many practitioners there is no organized assistance available. The defence societies in Great Britain are unable to provide defence for practitioners over-seas, and the only method of protection is to take out an individual policy with an insurance company. This policy is often very expensive: one member pays £16 per annum for £4,000 cover. The Council is therefore investigating the practicability of arranging with certain insurance companies an agreement which will enable members practising over-seas to obtain, on specially favourable terms, policies insuring them against charges of negligence or malpraxis. It has accordingly circularized the over-seas Branches in order to ascertain what support is likely to be forthcoming if a scheme could be arranged whereby a practitioner in return for a premium of about £2 could secure indemnity to the extent of £2,000. It is not yet known whether the companies would agree to such a scheme but the Council hopes to be able to find some method of enabling its over-sea members to enjoy the same protection in the matter of individual medical defence as their colleagues at home.

economic and not to health grounds. On the question of the rate of subscription a form of words was reached after some debate. Contributions of subscribers shall be such as to ensure to the member [that is, the practitioner] a rate of remuneration commensurate with the standard of fees charged in private to those who will be eligible to participate in the scheme.

The memorandum was accepted by the committee, as was also a further memorandum on the establishment and development of Public Medical Services. It is intended to publish this letter, together with the model scheme as an Association's 'grey' book, and, with the approval of the Council to publish as a separate document the scheme for the provision of medical attendance and treatment upon persons with incomes above national health insurance limits.

Provident Schemes and Payment for General Practitioner Services

Dr Robert Forbes, as chairman of the subcommittee which is inquiring into the practicability of payments to general practitioners under provident schemes, reported the steps which had so far been taken. Representatives of two important insurance companies had stated that they were not at present interested in schemes of this kind and had no actuarial calculations upon which to base a premium, and one of them said that such a scheme would necessitate a special organization. Another insurance company, however, stated that the scheme as drafted bore a close resemblance to one of its own which had been in operation for the last two years with moderate success, and the subcommittee proposes to make a fuller investigation in this direction.

Fees Paid to Medical Witnesses

The Police Surgeons Subcommittee brought forward a draft case in support of an increase of fees for medical witnesses in criminal prosecutions. The case was approved and subject to the decision of Council it will be submitted to the Home Secretary.

Other Medico-Political Business

At the previous meeting of the committee Dr H. E. Collier of Birmingham had attended to advocate the establishment of a diagnostic consultation clinic for diseases of occupation and industrial illness and disability. The committee now had the advantage of a memorandum on the subject by one of its members (Dr J. S. Manson), as well as information as to the relevant activities of the Industrial Health Research Board, the National Institute of Industrial Psychology, the Industrial Welfare Society, the London School of Hygiene and Tropical Medicine, and the Health Education Society. After discussion the committee reached the conclusion that it was not satisfied that a case had been made out for the separation of occupational from other diseases for the purpose of clinical observation.

It was reported that a meeting of prison medical officers had taken place in response to an inquiry by the Association as to whether they were satisfied with the recent improvement in their terms and conditions of service, and that the feeling of the majority of those present was that the time was not opportune to press further the matter of increased pay. The thanks of prison medical officers were conveyed to the Association for what it had done in the past and in anticipation, for what it would do in the future.

It was agreed to inform the National Safety First Association that the B.M.A. would join with it in making representations to the Ministry of Transport on the question of the removal of injured persons by incompetent people, a proceeding which often turns a minor injury into a major one. It was suggested that some advice on this subject might be embodied in the *Highway Code*. The

attention of the committee was drawn to a scheme for medical attendance on settlers and their families under the Land Settlement Association, a body which arranges for the resettlement of families from depressed areas. The Medical Secretary was authorized to enter into discussion with a view to the formulation of a scheme.

A statement as to the duties of a Parliamentary agent was laid before the committee, and it was agreed to recommend to the Council that such an agent be appointed to act on behalf of the Association.

A member of the committee brought forward an instance of what was said to be an increasingly common practice. He had been asked by an insurance company to examine a patient on its behalf in the presence of a doctor representing the patient. He discovered, however, that the doctor who was supposed to represent the patient and to whom the insurance company paid a fee, was not the patient's medical attendant, and in fact had never seen the patient before. He had been nominated by the patient's solicitors, and on inquiry the insurance company stated that this firm of solicitors as a rule nominated this same doctor and that the practice of solicitors nominating someone other than the patient's own medical attendant was becoming increasingly common. It was agreed to bring to the notice of the Accident Offices Association the Association's views on this practice.

ASSOCIATION OF REGISTERED BIO-PHYSICAL ASSISTANTS

Change of Name

At a meeting of the executive committee of the Association of Registered Bio-Physical Assistants held on April 15 a new title for the association was discussed and it was agreed that the association should in future be known as the Society of Physiotherapists. This change of title is made necessary by the formation of the *National Register of Medical Auxiliary Services* in which the *Roll of Bio-Physical Assistants* is now incorporated.

Membership of the Society of Physiotherapists will be limited to those termed physiotherapists in the *National Register of Medical Auxiliary Services* in the same way as membership of the Association of Bio-Physical Assistants was limited to those on the *Roll of Bio-Physical Assistants*. The Society of Physiotherapists is not an examining, qualifying or registering body. It is an organization supported by membership subscriptions and its principal aim is to represent its members by making their work known to the medical profession and the public thereby promoting the expert administration of physical methods of treatment and the ultimate elimination of the unqualified from the field of physiotherapy.

The Association of Bio-Physical Assistants was started in 1932 and its membership has increased steadily since. During this period the association had to refuse many qualified assistants who were not bio-physical assistants owing to the fact that its membership was limited to those on the Society of Apothecaries Roll. This matter had the attention of the annual meeting of the association in 1935 and a resolution was passed at that meeting to the effect that if and when the *National Register of Medical Auxiliary Services* came into being the association would widen its membership to include all those on the *National Register* and change its name to make it comprehensive of this wider membership.

The association has during the last few months accepted under its new constitution a number of new members from the *National Register* who will now be members of the Society of Physiotherapists. Membership of this society does not imply or give any diploma. Those who become members of it have already received by examination the qualifying certificate of their recognized examining bodies. The annual subscription to the Society of Physiotherapists (15s.) includes without further charge a subscription to the *British Journal of Physical Medicine*.

THE INSURANCE MEDICAL SERVICE WEEK BY WEEK

National Health Insurance in British Columbia

We turn aside for a moment from the home service to glance at the national health insurance scheme in British Columbia. Some of those who weathered the insurance storm of 1911 will find a reflex of the excitement in an issue of the *Labor Statesman*—owned and controlled by the Vancouver Trades and Labor Council—dated March, 1937. History repeats itself—with transatlantic trimmings. After the headlines 'Doctors Sabotage Insurance Act — "Medical Opposition is Based on Greed and Selfishness," we pass to a note of a meeting of the Labor Council, prefaced by a statement that the general public has been misled by a lot of unfair propaganda made by a greedy group of medical men, aligned with 'Big Business' and supported by a few fawning hypocrites." Then follows the report. A delegate stated that the doctors wanted to grab all that the traffic would bear and were not satisfied with the proposed remuneration which they would receive under the Act, despite the fact that it would amount to many thousands of dollars per year. The report continues:

This delegate pointed out that Walter Scribbens had called a meeting in opposition to the legislation and while this meeting was supposed to be for employees not a single union had been invited and the only union men who were present were there by accident. Employers sent representatives floor walkers foremen etc. who were supposed to be speaking for the rest of the employees in their establishments in opposition to the legislation. The meeting was held at 10 a.m. in the bosses' time. This said Delegate Showler was nothing else but a double-cross to the labor movement whom Scribbens was supposed to represent. As chairman of that meeting he was doing nothing else but taking sides with the business element and against the desires of the organized labor movement."

Secretary Bengough followed in the same vein. He said:

All kinds of tactics are being used to build up an opposition to the Act and we have just had the deplorable sight of an alleged union man acting as chairman of a meeting in which all the non union firms of the city were represented. While the Canadian Manufacturers Association and other employers organizations are actively opposing it the doctors are the spearhead of the movement. They are opposed on general principles to the State operating health insurance of any kind. And in this they have the support of the Canadian Association of the College of Physicians and Surgeons and also the American College because once this kind of legislation operates in British Columbia it will spread to other provinces and to the United States. Despite all the criticism this Act is miles ahead of the British Act and also the French Act and these two are the best in the world. If the present Act is not adequate the doctors are in the main to blame for the condition. The doctors had it scaled down from \$2 400 because it was taking away their best customers. They wanted the maximum placed at \$1 500 and in order to get the co-operation of the doctors the maximum was set at \$1 800. The British Act was limited to workers earning \$1 250 or less per year and dependants were not covered neither was hospitalization included. But even in that instance the doctors were opposed to it.

It is more informative though perhaps not so picturesque to turn from these observations and from the references to the attitude of the medical profession in the leading article to a sober statement extracted from the radio address made by the chairman of the Health Insurance Commissioners. In the course of this address he said:

At this point I should like to stress some of the good features of our British Columbia Act. It is without doubt a much broader Act than the British one. In the first place the income limit of those covered is much higher in the British Columbia Act—\$1 800 in British Columbia as compared to \$1 250 in England.

"2 Dependants of the insured are covered. Incidentally the British Medical Association is on record to the effect that their own health insurance plan should be expanded to include dependants of employees."

"3 The services of specialists and consultants are included whereas in England only the services of a general practitioner are available under the Act."

4 Hospital benefits are included and diagnostic aids, such as x rays are to be provided."

From the standpoint of providing needed medical services to the insured the British Columbia Act is a good Act.

The question of the remuneration of insurance practitioners is very much in evidence at the present time, and readers will be interested in the following further extract from the same radio address:

Is the offer of \$5.50 for each insured person per year reasonable payment for doctors' services? As for the adequacy of remuneration it is only fair to point out that the medical profession charges in accordance with the time honoured principle of ability to pay—that is, the higher the income of a man the higher the fees charged him as a rule. It is reasonable to apply this same principle to health insurance methods. At the instance of the College of Physicians and Surgeons of British Columbia the income limit of those to be covered by health insurance was reduced from \$2 400 a year to \$1 800 a year.

The Commission as the custodian of the funds to be collected from employers and employees, thinks that it is not justified in offering more than \$5.50 per insured person per year. On this basis more than \$1 000 000 will be paid each year to the doctors. For every 1 000 persons (not patients) the doctors will receive \$5 500. If a man his wife and three children are covered a total of \$27.50 per year will be paid to physicians. It should be pointed out that a considerable number of those covered will not consult physicians in any one year but the doctors will be paid for everyone whether they are ill or not.

When proper allowances are made for earnings of physicians from all sources including allowances for x ray and diagnostic services to the insured including fees from the Workmen's Compensation Board and fees paid directly to doctors by insured persons the returns of physicians in respect of insured persons will approximate the amount of \$730-\$750 per capita set by the Health Insurance Committee of the College of Physicians and Surgeons as fair payment for a complete medical service. The proposed amount of \$5.50 compares very favourably with the amounts which leading industrial contract schemes of medical practice in British Columbia now provide. In the opinion of the Commission \$5.50 will provide more money for doctors than they now collect through private practice for services to persons to be covered by health insurance. Incidentally the British Columbia Royal Commission on Health Insurance and Maternity Benefits recommended \$5.11 per insured person per year which sum included Workmen's Compensation Board work and was to apply to an insured group under \$2 400 per year. The offer of \$5.50 excluding workmen's compensation work and applying to employees under \$1 800 is a much more generous one."

As noted in the *Supplement* of May 15 (p. 294) this scheme has been postponed indefinitely.

Exemption from Emergency Night Calls

Exemption from night calls to other doctors' patients is something which can be claimed by an insurance practitioner in certain circumstances but also as we have previously noted in this column can apparently be imposed by the Insurance Committee. This has the curious result that a practitioner may have occasion to appeal

against an 'exemption' conferred upon him against his will

Here is a summarized report of a recent appeal in this connexion

On December 22 last we heard the appeal of Dr X. against the decision of the Insurance Committee exempting him from liability for emergency night calls to insured persons on the lists of other practitioners. The clerk explained that it was not the custom of insurance practitioners in the area to make claims for rendering emergency treatment to insured persons on the lists of other practitioners in the area

Dr X stated that his residence was three and a quarter miles by road from his surgery and that the journey by the route which he always followed only occupied seven or eight minutes by car. He further stated that there was a resident caretaker at his surgery which was connected by telephone with his residence. It was now a year since he moved his residence from the surgery and during that time he had been able to carry out his duties in relation to his insured patients as easily as when he resided at the surgery, and he found no difficulty in fulfilling his obligation in regard to emergency work in both places. He had had very few night calls for emergency treatment to insured persons, either on his own list or on the lists of other practitioners. No complaint had been made, whether by insured persons or other practitioners in regard to his attention to insured persons either in cases of emergency or otherwise

After reciting the contentions of the Insurance Committee and the doctor respectively the persons appointed to hear the appeal continued

It appeared to us that the number of emergency night calls in the area is very small and it has not been established to our satisfaction that Dr X. is unable by reason of the fact that he resides at a greater distance than two miles from his surgery, to fulfil his obligations in regard to emergency night calls to insured persons on the lists of other practitioners in the area or that the number of such calls which is likely to be received is materially affected thereby

"We accordingly recommend that the appeal should be allowed."

Naval, Military, and Air Force Appointments

ROYAL NAVAL MEDICAL SERVICE

Surgeon Rear Admiral P. T. Nicholls to the *President* for service inside the Admiralty Medical Department

Surgeon Captain R. F. P. Cory to the *President* for course

Surgeon Commanders M. B. Devane to the *Victory* for Royal Naval Barracks, J. A. Cusack to the *Pembroke* for Royal Naval Barracks, A. W. Gunn to the *Victory* for Royal Naval Barracks, A. W. McRorie to the *President* for course

Surgeon Lieutenant Commander F. Dolan to the *Drake* for Royal Naval Barracks

Surgeon Lieutenants G. H. C. R. Critien to the *Drake* for Royal Naval Hospital Plymouth, R. M. Kirkwood to the *Pembroke* for Royal Naval Barracks (May 16) and to the *Pegasus* (May 22) R. M. Bremner to the *Hastings*, D. D. Steele-Perkins to the *Ganges*, I. C. Macdonald to the *Cardiff* (May 12) and to Royal Naval Barracks Chatham (May 22) D. B. Jack to the *Pembroke* for Royal Naval Barracks

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Sublieutenant C. P. Nicholas to be Surgeon Lieutenant

ROYAL ARMY MEDICAL CORPS

Lieutenant P. Coleman to be Captain

Lieutenants (on probation) C. McNeil and F. J. S. Baker are seconded under the provisions of Article 21st Royal Warrant for Pay

The following candidates have been selected for short service commissions as Lieutenants (on probation) F. Livesey, C. E. McCloghry, C. McNeil, G. G. Sherriff, G. M. Curtis, J. B. Bunting, R. B. Robertson, A. T. M. Glen, E. Garah, K. F. Stephens, G. M. Robertshaw, R. L. Townsend, F. J. S. Baker, O. Jordan, N. Bickford, O. W. W. Clarke, J. B. Dancer

ROYAL AIR FORCE MEDICAL SERVICE

Flight Lieutenants R. E. Alderson and J. Kemp to be Squadron Leaders.

REGULAR ARMY RESERVE OF OFFICERS

Colonel C. D. Myles O.B.E., late R.A.M.C. having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers

ROYAL ARMY MEDICAL CORPS

Lieut.-Colonel G. H. Stevenson D.S.O., having attained the age limit of liability to recall has ceased to belong to the Reserve of Officers

MILITIA

ROYAL ARMY MEDICAL CORPS

Major R. D. Goldie has relinquished his commission and retained the rank of Major

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Captain E. J. G. Glass to be Major
F. C. Angior, P. Howe (late Officer Cadet, Liverpool University Contingent Senior Division O.T.C.) E. H. P. Smith (late Cadet Sergeant Epsom College Contingent, Junior Division O.T.C.) K. G. S. Bavidge (late Officer Cadet Durham University Contingent, Medical Unit, Senior Division O.T.C.) A. G. McCallum (late Officer Cadet Glasgow Academy Contingent, Junior Division O.T.C.) T. Fitt (late Cadet Sergeant Rossall School Contingent Junior Division O.T.C.) R. H. Barnes (late Cadet Sergeant Bedford School Contingent Junior Division O.T.C.) and J. D. Finlayson (late Officer Cadet Aberdeen University Contingent, Medical Unit, Senior Division O.T.C.) to be Lieutenants

TERRITORIAL ARMY RESERVE OF OFFICERS ROYAL ARMY MEDICAL CORPS

Captain D. M. Machenzie from Active List to be Captain

COLONIAL MEDICAL SERVICE

The following appointments are announced E. N. Brockway M.B., B.S. Medical Officer, West Africa A. A. Cameron M.B. Ch.B., Medical Officer Malaya Miss Euphemia Cardwell L.R.C.P. and S.Ed. L.R.F.P.S. Glas Lady Medical Officer Gold Coast R. H. Purnell M.B. B.S. Medical Officer Northern Rhodesia Surgeon Lieutenant S. R. G. Pimm L.M.S.S.A. D.M.R. Medical Radiologist Colonial Hospital Port of Spain, Trinidad J. A. Acheson M.D. D.P.H., Senior Medical Officer Northern Rhodesia H. J. Birmingham L.R.C.P. and S.Ed., Medical Officer Gold Coast, C. J. Fournier M.D. Medical Officer West Africa

DISPENSING CAPITATION FEE

SIR—There is one aspect of rural panel practice that I think needs investigation—namely the rates of payment for drugs to the dispensing doctor. In one county in which I practise the average cost per insured person per year for drugs supplied by the chemists was 2s. 8½d. The capitation rate paid to those of us who have all the bother of dispensing (and frequently of delivering) drugs is 2s. 3d. Obviously we are losing on the average 5½d. per person per year.

I hope the appropriate committee will take this point up when they are dealing with the revision of fees—I am, etc.

Hockley Heath Birmingham May 9

H. F. BURTT

FILM PROJECTOR SERVICE

The National Ophthalmic Treatment Board which administers the scheme popularly known as the National Eye Service has produced several sound recorded films explaining the need for medical examination in all cases of eye trouble and the simplicity of obtaining it through the National Eye Service. The Board is of the opinion that these films might be of interest to members of the British Medical Association and is prepared accordingly to lend copies for exhibition at Division Meetings free of charge. Many Divisions possess the necessary film projector but to those which do not the Board is willing to lend without charge full projector equipment together with the services of a trained operator for the projection of the films and of any other films which it might be decided to include to build up a programme of general interest to practitioners. Applications for the loan of films and for the projector service where it is desired should be made to the General Secretary, the National Ophthalmic Treatment Board 148/150 Great Portland Street London W.1

ANNUAL MEETING, BELFAST

SPEAKERS AT SCIENTIFIC SECTIONS ACCOMMODATION

It is requested that all those who are speaking at the various Scientific Sections, and who require accommodation but have not yet reserved it, will communicate at once with the Chairman Housing and Lodgings Committee, Whitla Medical Institute College Square North Belfast. Accommodation is now extremely limited so far as hotels are concerned and the hostels are nearly booked up so that unless immediate application is made lodgings will be the only form of accommodation available.

HOTEL ACCOMMODATION

First-class accommodation is still available at the Shieve Donard Hotel Newcastle, Co Down Laharna and Olderslee Hotels Larne, Co Antrim Regent Palace Hotel and Royal Hotel Bangor Co Down, the Mount Royal Hotel and the Imperial Hotel, Donaghadee Co Down. These are suitable for members who intend bringing their cars. Application for these should be made direct to Messrs Thos Cook and Son 27, Royal Avenue Belfast, but applications for private hospitality, lodgings or students hostels should be address to the Secretary, B.M.A., Whitla Medical Institute, College Square North, Belfast.

GARAGES IN AND AROUND BELFAST

The following is a list of garages which has been compiled by the A.A. and the R.A.C.

Stanley Harvey and Co 20 Adelaide Street
W J McCrum 7 Antrim Road
J E. Coulter Ltd., 40 Antrim Road

ANNUAL DINNER JULY 22

The Dinner Committee wishes to remind members that booking for the Annual Dinner is proceeding rapidly, and in spite of the fact that there is seating accommodation for over 1,100 it is almost certain that this will be taxed to the utmost. The following tables are still available 10, 12, 13 15, 17, 19, 25 35 36, 46 54, 58, 61, 64 67, 70, 73, 76 79 80 82, 85, 88, 91, 94, 97, 102, 104-110 Applications accompanied by remittance for 10s 6d for each ticket, should be made to the Dinner Secretary, B.M.A. Office Whitla Medical Institute, College Square North, Belfast.

PATHOLOGICAL MUSEUM

The accommodation available in the Physics Laboratories where the Museum will be housed is limited to some four hundred pathological specimens. The Museum of the Institute of Pathology Queen's University can supply some 350 of these documented with clinical history, prints of radiographs electrocardiograms etc. These have already been selected and their data assembled for the preparation of the catalogue. So far as possible it is desired to avoid reduplication, and for that reason no requests for museum exhibits are being circulated. On the other hand there are certain scientific discussions which cannot be illustrated adequately out of local resources and it is the intention of the Museum Committee to approach individuals who are likely to be able to fill these gaps in the hope that they will co operate to ensure the success of the exhibition. The Museum Committee would like to make it clear that they will be glad to receive specimens of outstanding pathological interest from other persons, whether they are taking part in the scientific discussions or not. Anyone able to help in this way is asked to communicate with Dr J A Fisher, Honorary Secretary, Committee of the Pathological Exhibition at the Institute of Pathology Grosvenor Road, Belfast, not later than June 7 so that cards and labels may be supplied.

ANGLING

Those who are interested in fishing are reminded that there is a great deal of free water in Northern Ireland. In addition two of the local angling associations the Northern Flyfishers Club and the Belfast Anglers Association have granted us facilities for fishing their specially reserved and stocked waters during the meeting. Visitors are assured of enjoying this sport, and a considerable number of permits have been put at the disposal of the Local Executive Committee. These will be available on application at the Reception Room and a limited number of previous applications will be accepted at the office of the Meeting Whitla Medical Institute College Square North Belfast.

Corrigendum—The title of the paper to be read by Dr A B MacLean in the Section of Radiology at the Belfast Meeting is "Nomogram for Radiography."

Formation of Central Provinces Branch

With reference to the preliminary notice in the *Supplement* of February 20 (p 94), the Council hereby gives notice to all concerned of the formation of a Central Provinces Branch of area coterminous with the Central Provinces of India, the new Branch to come into existence as from the date of this notice

G C ANDERSON

Medical Secretary

May 22 1937

Branch and Division Meetings to be Held

ABERDEEN BRANCH CITY OF ABERDEEN DIVISION—Tuesday May 25 Dr Adolf Adler Value of Child Guidance

BATH BRISTOL AND SOMERSET BRANCH—At Royal United Hospital, Bath, Wednesday May 26 8.15 p.m. Mr A Leigh Allergy in the Ear Nose and Throat

BERKS BUCKS AND OXFORD BRANCH OXFORD DIVISION—At Radcliffe Infirmary, Wednesday May 26 8.30 p.m. Clinical meeting.

FIRTH—On May 17 1937 Arthur Marcus Firth M.A., M.D. Medical Superintendent of the Worcestershire Mental Hospital Barnley Hall Bromsgrove aged 62 years

cent) contracted influenza. This result appears to show that very little, if any, spread of infection can be attributed to public conveyances. It is realized that those people who do not travel to and from work by this means may do so after working-hours for pleasure, but in that case the 'rush hour' would be over and close contact not so likely. It is possible that the walkers or cyclists have slightly increased resistance.

Influenza is not a notifiable disease and it is impossible to obtain reliable statistics as to its incidence. In times of epidemics certain catarrhal affections of the throat and bronchial tubes are undoubtedly called influenza when possibly they are not. It is difficult to say clinically where a feverish cold ends and influenza begins. It is reasonably certain however, that the bulk of the cases under review were caused by the same virus. A very large number of the patients were seen and were sent off from work by the same medical officer. It is known that the epidemic was widespread throughout the country, and presuming that there are ten million people employed in industry to-day it would mean that something like two million wage earners contracted the disease in two months—that is if the incidence rate for industry as a whole was the same as that shown in this paper. Furthermore, the total amount of illness for all affected workers must have approached twenty million days. It is agreed that the later figures are pure conjecture, but it must be remembered that only about 25 per cent of the population have been considered.

Conclusion and Summary

A study of certain aspects of an epidemic of influenza as it affected a number of industrial workers—that is, wage earners—has been made.

It has been shown that in spite of modern premises, good food, at well arranged canteens, rest periods, and hygienic conditions generally, 1,214 workers out of 6,354 (19.1 per cent) contracted influenza within a period of two months.

In this study the virus showed a predilection for females and for the young worker of both sexes. Also the factory worker of both sexes showed a higher incidence rate as compared with other classes of worker of the same sex.

The suggestion has been made that it is industrial workers who are the first to be attacked by epidemics of influenza and that much of the spread takes place at work and is due to unavoidable contact and not to poor hygienic conditions.

The relation of public conveyances, if any, to the spread of epidemic influenza has been discussed. The evidence produced shows no relation.

Statistics have been compiled showing incidence, duration of the illness and of previous attacks.

Arrangements are being made to hold the fourth International Leprosy Conference in Cairo beginning on March 21, 1938. It is being organized by the International Leprosy Association and will be the first international conference to be arranged by that body since its inauguration in 1931. Three previous conferences of this nature have been held—at Berlin in 1897, at Bergen in 1909 and at Strasbourg in 1923. The Egyptian Government is inviting all countries concerned to send official delegates. In addition to these and the members of the International Leprosy Association, doctors and others interested in the subject are invited to be present. Full information can be obtained from the secretary of the International Leprosy Association, 131, Baker Street, London, W.1.

A MALARIAL TREATMENT CENTRE THE UNIT AT HORTON MENTAL HOSPITAL

A report summarizing the results of observations made by Dr W. D. Nicol, medical superintendent of Horton Hospital during a recent visit to the nerve psychiatric clinic at Vienna, where the treatment by induced malaria of cases of general paralysis of the insane was established originally by Professor Wagner Jauregg, has been presented to the London County Council. Dr Nicol also visited the Steinhof, a large mental hospital outside Vienna, the research department in neuro histopathology at the Kaiser Wilhelm Institute at Munich, the nerve psychiatric clinic under the charge of Professor Kleist at Frankfurt, and the mental hospital at Düsseldorf under the administration of Professor Sioli, as well as the Bayer chemical factories at Leverkusen and the research laboratories at Elberfeld between which and Horton Hospital there has been close co-operation for some years in the provision of opportunity for the use of anti malarial drugs.

A Twofold Purpose

The Mental Hospitals Committee, in bringing forward to the Council Dr Nicol's report, states that the special unit at Horton Hospital established in 1925 in conjunction with the Ministry of Health as a centre for the treatment by induced malaria of cases of general paralysis of the insane serves not only its immediate purpose but as a means for the study of malaria itself, a matter of great importance in view of the close and constant relations between this country and other parts of the Empire where malaria is endemic. The laboratory technique and the development of the entomological side of the work in breeding and infecting mosquitoes have been copied and reproduced in other centres in Europe. The clinic at Vienna has adopted the Horton laboratory technique of examining blood films, the plans of the insectarium in which mosquitos are bred at Horton Hospital have been reproduced in Germany, Rumania, and Holland. The malaria research at Horton, which has been made possible only by team work on an organized scale, has attracted outside workers from all parts of the world. The medical care of cases by one of the medical officers, the charge of the laboratory under Mr Shute and two laboratory assistants, the clerical aid given by the Ministry of Health, and the direction of the work by Colonel James have contributed to the establishment of a research centre on a sound scientific basis. Since Colonel James's recent retirement a liaison has been effected between Horton and the London School of Hygiene and Tropical Medicine, and recently a whole time worker with a research fellowship from the Royal Society has started his studies at Horton. The arrangements which were under the direction of Colonel James have now been taken over by Professor J. G. Thomson of the School of Tropical Medicine.

Research in Neurosyphilis

Active treatment of general paralysis of the insane has gone on vigorously at Horton Hospital but there has not until recently been opportunity there for the prosecution of research in general paralysis and in neurosyphilis to a degree comparable with the research in malaria. That deficiency has now been remedied and a start has been made at Horton with the appointment of a whole-time research worker (Dr E. L. Hutton) and a clerical assistant who will help in the compilation of the records upon which successful investigation of large numbers of cases must depend. Facilities are needed too for dealing with cases of asymptomatic neurosyphilis; it would appear that there is a prospect of the successful application of malaria as a therapeutic means in preventive medicine. An inquiry is now being made into the incidence of syphilis in families of general paralytics. The report to the L.C.C. adds that some 800 cases have been treated at Horton.

Hospital since 1925 and a large unexplored field of research relating to the problem of neurosyphilis is open to workers who should be attracted to the centre at Horton just as during the past ten years malarialogists have been attracted

FELLOWSHIPS AND APPOINTMENTS IN TROPICAL MEDICINE

The Medical Research Council advised by its Tropical Medical Research Committee (appointed after consultation with the Colonial Office) announces the following

Junior Fellowships—Three junior Fellowships are offered immediately for award to qualified medical men wishing to receive training with a view to careers in research work in tropical medicine. Preference will be given to candidates who have already had preliminary experience of methods of research in some branch of medical science. Subject to satisfactory reports, the Fellowships will be tenable for three years. The first year will be spent at a school of tropical medicine, the second in carrying out research in the same or other institution at home and the third largely in work under direction at some centre in the Tropics. The stipend will be at the rates of £300 £400 and £500 per annum in the successive years, with an additional allowance during service abroad and necessary expenses. The Council has every reason to believe that men who undergo this training will be eligible and well qualified for various appointments apart from the prospects of further employment under the scheme.

Senior Fellowships—In three years time at least one senior Fellowship will be available for candidates who have held the junior Fellowships mentioned above. This will be awarded for a further period of three years carrying stipend at the rate of £600 to £750 per annum, with an additional allowance during service abroad and expenses. The time will be spent mainly in research work in the Tropics. The Council is also prepared to consider immediate applications for senior Fellowships from candidates who have had adequate experience in research work whether already specially trained in tropical medicine or not.

Permanent Appointments—The Council further intends to establish in due course as suitable investigators become available as the result of the Fellowships scheme, permanent and pensionable appointments for research work in tropical medicine including senior posts. Members of this research staff will work partly in the Tropics and partly in institutions at home to which they will be severally attached. The exact terms of service are still undecided but they will be not less favourable than those which apply to other Government appointments at home or over seas for men of similar professional standing.

Inquiries may be addressed to the Secretary, Tropical Medical Research Committee, 38 Old Queen Street London SW1 with whom applications should be lodged not later than June 15 1937.

INTERNATIONAL UNION AGAINST TUBERCULOSIS

Date of Adjourned Tenth Conference

The tenth Conference of the International Union against Tuberculosis which was to have been held last year has now been arranged to take place at Lisbon from September 5 to 9 next under the chairmanship of Professor Lopo de Carvalho the secretary-general of the Conference is Dr. Castello Branco. Discussion will be limited to three main subjects: biological subject: Radiological Aspects of the Pulmonary Hilum and their Interpretation; opening report by Professor Lopo de Carvalho (Portugal), clinical subject: Primary Tuberculosis Infection in the Adolescent and the Adult, opening report by Dr. Olaf Scheel (Norway); social subject: The Open Case of Tuberculosis in Relation to Family and Domestic Associates; opening report by Drs. J. Hatfield (United States) and D. A. Powell (Great Britain). Ten speakers chosen in advance from a list presented by forty-four countries belonging to the Union have been designated to open the discussion on each of the questions on the agenda.

Members of the International Union are invited to take part in the Conference without fee. They may forward their application either through their Government or their national organization against tuberculosis, or directly to the Organizing Committee of the Tenth Conference of the International Union against Tuberculosis, Assistancia Nacional aos Tuberculosos, Avenida 24 de Julho, Lisbon, Portugal. Names may also be sent to the headquarters of the Secretariat of the International Union against Tuberculosis, 66 Boulevard Saint Michel, Paris (6e). Persons who are not members of the Union and who wish to take part as "Members of the Conference" must forward their applications together with a contribution of 200 escudos, exclusively through the medium of the National Association for the Prevention of Tuberculosis, Tavistock House, North Tavistock Square, London W.C.1. Members of the Conference who sent in their contribution last year are exempted from any further payment.

LEON BERNARD MEMORIAL FUND

A prize to the value of 2,500 French francs is to be awarded biennially by the International Union in memory of the late Professor Leon Bernard, who was its founder and for fourteen years general secretary. This will be awarded for the first time in 1938 for an original essay in either English or French on the social aspect of tuberculosis. The essay which must be typewritten and not exceeding 10,000 words must be forwarded by a Government or an association belonging to the Union to the Paris address given above not later than May 1 1938. Should the executive committee of the Union whose decision is final decide that no essay submitted is of sufficient merit the prize will not be awarded in 1938 but will be offered again in the following year.

SCHOLARSHIPS AT THE CARLO FORLANINI INSTITUTE

Members of the Union are reminded that the Italian Fascist National Federation against Tuberculosis places at the disposal of the Union six scholarships to the value of 2,000 lira respectively plus board and lodging, at the Carlo Forlanini Institute in Rome. These scholarships which are preferably given to young physicians who are already familiar with tuberculosis problems and who wish to improve their knowledge in this branch of medicine, will be awarded at the next session of the executive committee which meets in Lisbon in September next. The names of candidates, accompanied by particulars as to age, qualifications and professional experience must be forwarded by a Government or an association belonging to the Union to 66 Boulevard Saint Michel, not later than July 5 next.

In response to the desire expressed by many readers of the publications of the Health Section of the League of Nations the following changes have been made in the *Epidemiological Report* from January, 1937, onwards. The tables relating to infectious diseases and demography now appear again in monthly parts, and are issued in foolscap size. Opposite the current figures which are arranged in periods of four weeks or by months or quarters the median figures for the corresponding periods of the previous thirteen years are given for purposes of comparison as they form a valuable epidemiological index. The text of articles and monographs on epidemiological subjects will in future appear in the *Bulletin of the Health Organization of the League of Nations*. Readers of the *Epidemiological Report* who are not subscribers to the *Bulletin* will receive these articles as they are published in the form of off-prints (6½ by 9½ inches) so that they can be bound separately. The French and English texts of the *Bulletin* are issued in separate editions and the same practice will be followed for off-prints of epidemiological articles. Readers should inform the Distribution Service of the League of Nations, Geneva, whether they wish to receive the French or the English edition.

Nova et Vetera

"ISIS"

ISIS which is the quarterly organ of the History of Science Society and of the International Academy of the History of Science contains in its March number¹ four articles that are of medical interest. The first dealing with the discovery of x rays is from the pen of George Sarton D Sc, founder and editor of the journal. He introduces the subject with a short but clear summary of the progress of electrical knowledge towards the creation of a vacuum. He then gives a biography of Wilhelm Konrad Röntgen who was born in 1845, discovered the x rays on November 8 1895 whilst he was professor of physics at Würzburg, and died at Munich in 1923. The article ends with a facsimile reproduction of Röntgen's first account of his discovery. This appeared in the *Sitzungsberichte der Physikalisch medicinische Gesellschaft of Würzburg* on December 28, 1895 which was distributed to the members early in January, 1896. It attracted attention immediately, for *Nature* published a translation on January 23 1896, the *Electrician* on January 24, and *Science* on February 14 in the same year.

Dr Aydın M Sayılı of Harvard University writes on Uygur medicine, which was pre-Islamic. The climax of the political and military powers of the Uygurs—a Turkish speaking people of Central Asia—was in the eighth century of the Christian era. His study shows that the Uygurs possessed a sound and well-defined medical knowledge which appears to have been slightly in advance of Saxon medicine of the same period. The system was secular and was free from spiritual, magical, and religious elements. He then proceeds to consider Turkish medicine in the Moslem world and shows how much still remains to be done in connexion with its history. His paper is especially valuable for it proves that Turkish doctors are beginning to show an interest in the history of their profession. The Institute of the History of Medicine was founded in 1933, and was at once affiliated to the Istanbul University.

The article written by Lieut-Colonel E E Hume tells the story of the inception and growth of the Army Medical Library at Washington USA. It is illustrated with excellent portraits of John Shaw Billings and Fielding H Garrison—household words to all who use the *Index Catalogue*. Colonel Hume, like all librarians wants more room. He points out incidentally that about one thirtieth of the world's literature is medical and draws attention to the fact that the books in special libraries are much more often consulted than when they form part of a general collection.

Miss Kate C H Mead contributes an article on the medicine of the Lapps and there is an appreciative review by Miss Mary Catherine Welborn of the book on John Mirfield recently written by Sir P Horton-Smith Hartley and Mr H R Aldridge. The whole number is interesting and the printing and format do credit to the Saint Catherine Press Ltd., of Tempelhof, Bruges by whom it is printed in Belgium.

OLD MEDICAL BOOKS

A few old medical books have appeared recently in the London book market. On April 12 and following days Messrs Sotheby's auction catalogue included Gabriel Fallopius on *Ulcers and Tumours* Venice 1563. Galen's works edited by L Fuchsius Paris about 1550. Cardanus' *Commentaries on Hippocrates* Basle 1564. Miles Coverdale's most excellent and perfect homish apothecary

or homely physick booke for all the grefes and diseases of the bodye, Cologne 1561. In the sale on April 26 there were sold in several lots 199 letters by Dominique Jean Larrey (1766-1842) surgeon-in-chief of Napoleon's Armies, written during the various campaigns from 1798 to Waterloo, they deal with all kinds of medical as well as military affairs. Of medical interest, if not a medical book, in the same sale is a copy of the first edition of *Pantagruel* Paris 1546, by 'M Franc Rabelais docteur en médecine'. There are thought to be at most two other copies in existence, and possibly only one.

Reports of Societies

OTITIS MEDIA IN EARLY CHILDHOOD

At the meeting of the Section of Otology of the Royal Society of Medicine on May 7 the subject of discussion was otitis media in early childhood. The president Dr DOUGLAS GUTHRIE said that this subject had been discussed by pathologists and paediatricians for many years, but appeared to have attracted only slight attention from otologists, possibly because the cases did not come under their supervision being seen rather in general medical wards and at necropsy. The problem was whether the infection of the middle ear which was so extremely common in infants suffering from any disease whatsoever was a primary condition or a secondary phenomenon of comparatively slight importance. The council of the Section, in endeavouring to secure the views of otologists found that very few had paid much attention to the problem and to secure material for discussion which was to have been limited to otitis in infants, the subject was extended to children up to the age of 5.

French and English Experience

Dr LE MÉE of Paris opened the discussion with a few remarks on his experience of otitis in children under 15 months. He showed some excellent coloured slides of the normal and pathological tympanic membrane in infants and drew particular attention to what he called the frosted tympanic membrane dotted over with little grains. He said that this appearance was very often found in infants and was quite characteristic. There was such a condition as a latent otitis in which the external symptoms were only general or systemic. This type of otitis must be suspected whenever there was a febrile condition without evident cause. A very important symptom was a certain localized convulsion, especially ocular. On making an incision of a suspected tympanic membrane pus was not always found but it might appear later. It was well to remember that otitis media meant an infection of the whole of the middle-ear tract—mastoid, antrum, middle ear and tube. There was no barrier dividing the tympanum from the mastoid.

His indication for myringotomy was one sleepless night. If the child had one sleepless night with ear trouble he operated next day. Dr Le Mée proceeded to describe his method of operation in mastoid cases. He always carried out this operation in infants in two stages incising the periosteum and, one or two days later removing the bone. A few years ago he was impressed by the number of cases in which a very high fever had followed the carrying out of the operation in one stage. Since operating in two stages such complications had not occurred. Surgery in the infant must be minimal.

Analysis of Cases

Dr T RITCHIE RODGER gave an analysis of all cases of acute otitis media seen in children under 3 years of age.

Hospital since 1925 and a large unexplored field of research relating to the problem of neurosyphilis is open to workers who should be attracted to the centre at Horton just as during the past ten years malariologists have been attracted

Reports of Societies

OTITIS MEDIA IN EARLY CHILDHOOD

At the meeting of the Section of Otology of the Royal Society of Medicine on May 7 the subject of discussion was otitis media in early childhood. The president, Dr. DOUGLAS GUTHRIE said that this subject had been discussed by pathologists and paediatricians for many years but appeared to have attracted only slight attention from otologists possibly because the cases did not come under their supervision being seen rather in general medical wards and at necropsy. The problem was whether the infection of the middle ear which was so extremely common in infants suffering from any disease whatsoever was a primary condition or a secondary phenomenon of comparatively slight importance. The council of the Section in endeavouring to secure the views of otologists found that very few had paid much attention to the problem, and to secure material for discussion which was to have been limited to otitis in infants, the subject was extended to children up to the age of 5.

French and English Experience

Dr. LE MÉE of Paris opened the discussion with a few remarks on his experience of otitis in children under 15 months. He showed some excellent coloured slides of the normal and pathological tympanic membrane in infants and drew particular attention to what he called the frosted tympanic membrane dotted over with little grains. He said that this appearance was very often found in infants and was quite characteristic. There was such a condition as a latent otitis in which the external symptoms were only general or systemic. This type of otitis must be suspected whenever there was a febrile condition without evident cause. A very important symptom was a certain localized convulsion especially ocular. On making an incision of a suspected tympanic membrane pus was not always found but it might appear later. It was well to remember that otitis media meant an infection of the whole of the middle-ear tract—mastoid antrum middle ear and tube. There was no barrier dividing the tympanum from the mastoid.

His indication for myringotomy was one sleepless night. If the child had one sleepless night with ear trouble he operated next day. Dr. Le Mée proceeded to describe his method of operation in mastoid cases. He always carried out this operation in infants in two stages incising the periosteum, and one or two days later removing the bone. A few years ago he was impressed by the number of cases in which a very high fever had followed the carrying out of the operation in one stage. Since operating in two stages such complications had not occurred. Surgery in the infant must be minimal.

Analysis of Cases

Dr. T. RITCHIE RODGER gave an analysis of all cases of acute otitis media seen in children under 3 years of age.

at the Victoria Hospital for Sick Children, Hull, during nine years. The cases numbered 599, and 249 of them were bilateral. Of these 185 were in children under 1 year of which 80 were bilateral, 200 were in children from 1 to 2 years, 86 being bilateral, and 214 were in children aged from 2 to 3, the bilateral cases numbering 83. Mastoid operation was required in 19 per cent of all the affected infants and in 26 per cent of the older children. The importance of the high incidence of bilateral involvement was that it indicated the necessity for examining both ears even when the mother had noted discharge or evidence of pain on one side only. Symptoms in the second ear might make themselves obvious several days or even two or three weeks after the first signs in the other ear. A common feature had been the coincidence of a pulmonary condition. The incidence of tuberculosis had been surprisingly low. It had not been possible to ask for a routine examination of material discharge or of the products of the mastoid operation where such had been performed, as there was no pathologist attached to the hospital and all work of that kind had to be paid for. Specimens had been sent, however, when the signs were at all suggestive. Even then the large majority of reports had been negative. As the cases which aroused suspicion were fewer than one in ten it followed that the estimate of the incidence of tuberculosis was under 5 per cent. This estimate might be compared with some of those mentioned when the subject was discussed in the Section in 1914, especially the figures from Edinburgh given by Turner and Fraser. Had the pure milk campaign made all this difference in less than a quarter of a century? It was true that in 1914 the incidence of tuberculosis in Edinburgh was accepted as being much higher than in most English towns. Moreover, the percentage of tuberculous cases in a series could be lowered by an increase of non-tuberculous cases as by a diminution of tuberculosis. With increased knowledge on the part of both parents and practitioners, and the stimulus of child welfare workers, a very much larger number of cases of the milder and more transitory type of otitis were now seen than was the case a generation ago. Further, it might be that non-tuberculous otitis media not only escaped attention less often, but was actually more common. But allowing a sufficient discount for all these factors, the comfortable reflection might be made that this generation had witnessed a large diminution in the incidence of tuberculous otitis.

Findings at Necropsy

Dr J H EBBs of Birmingham reported on the post-mortem examination of the middle ear and mastoid antrum of 880 children, of whom 80 per cent were under 2 years of age. These were children who had died from all types of medical and surgical conditions. Purulent material in one or both ears was found in 52.8 per cent. Of the children who had died in their first year 62 per cent had otitis media, though he was not implying that the children found with otitis media at necropsy had necessarily died as a direct result of that condition. An analysis also showed that 238 of the children under the age of 2 years had suffered from gastro-enteritis characterized by severe diarrhoea and vomiting. Of these 238 cases 193 had otitis media.

He added a few personal observations on the clinical aspects of this problem. He was often asked particularly by new residents, how they were to diagnose the otitis media mastoiditis, and sinusitis so often found in these cases at necropsy. They said this was quite simple in the cases which showed the classical signs and symptoms but unfortunately such conditions were rare, particularly when there was gastro-enteritis. The more common finding was either a dull red or grey lustrous drum. On incision there might or might not be a discharge. The temperature charts of these children varied greatly. The high temperatures found were associated with the acute type of

otitis media. Some cases showed a low grade irregular temperature of about 99° to 100° F. Others a normal or subnormal temperature. He had observed from the charts of these cases that a great number of them showed their infection by a distinct rise in the pulse rate rather than by a rise in temperature. Very often these infants would go for a week or ten days with a temperature of 96° or 97° F, yet the point where the infection started could be picked up by a rise in the pulse rate from 140 to 160 or 170. Out of seventy-six infants dying of meningitis other than tuberculous meningitis, fifty-eight had otitis media. Of the cases with meningococcal meningitis twelve out of twenty had otitis media, of those with streptococcal meningitis, twenty-two out of twenty-three, and of those with pneumococcal meningitis ten out of fourteen.

Finally with regard to prophylaxis, the first point was breast-feeding. Out of this large number of cases only two of the infants had been breast-fed for any appreciable length of time. When they were breast-fed they usually survived gastro-enteritis or pneumonia. The best insurance that a mother could give to her newborn child was to attempt to breast-feed it during the first few difficult months of life. It was difficult to impress upon adults the danger of exposing the infant to acute upper respiratory affections such as the common cold or influenza which they might be suffering from themselves. It must be apparent that there was a great field for co-operation between the paediatrician and the ear, nose and throat surgeon. He went on to make a few comments on general paediatric aspects.

Paracentesis

Mr W STIRK ADAMS of Birmingham showed a chart giving the number of times paracentesis was performed in the out-patient department at the Children's Hospital in that city over a period of years. It was observed that there was a winter peak, and that the curve reached its lowest point about September in each year. Mastoid operations had been performed during the last two years on twenty-six children under 2 years of age with primary otitis, and twenty-five had recovered as a result of the surgical treatment. In ten cases of secondary otitis in the diarrhoea and vomiting group the question was asked whether the surgeon could help by doing mastoid drainage. As the child was going to die unless something was done, the only possible answer was to undertake the operation. After the opening of the mastoid six infants died and four recovered. These children came into hospital dehydrated, they got the appropriate treatment on the medical side and whatever was necessary and usually within two days they were very much better. Those that were destined to recover did so quickly, the others lingered on their condition fluctuating from day to day.

Dr C E SCOTT stated that in the years 1934-6 inclusive 564 cases of suppurative otitis media had been treated in the ear and throat department of the Royal Edinburgh Hospital for Sick Children. Of this number 145 were under 1 year, 419 were over 1 and under 5 years of age. Operative treatment was given in 154 cases—thirty-four under 1 year and 120 over 1 year. In considering the value of different operations myringotomy was performed fifty-two times in this series and fourteen of these cases required a subsequent Schwartz mastoid operation. Myringotomy was not an important factor in the avoidance of subsequent mastoid operation in these age groups but this was not to be interpreted as an argument against myringotomy as other factors came up for consideration, such as the ultimate resolution and restoration of hearing. Many of the Schwartz mastoid operations had been performed in the absence of acute mastoid symptoms but with a discharge persistently profuse. The temperature was generally settled but the pulse rate remained raised. The value of tonsil and adenoid removal had not been overlooked in treatment. With regard to tuberculous infection of the middle ear this condition was at one time

much more common, but was now apparently on the decline. During the three years under consideration a series of only nine cases had been collected of which seven were under 1 year. In these cases there was a definite history of bottle feeding in four and no record in the other five. Dr R. B. LUMSDEN of Edinburgh added a few further points to his colleague's analysis. In a small series of cases in a hospital thirty-five miles from Edinburgh he had found in one year an incidence of tuberculous infection amounting to nearly 40 per cent.

General Discussion

Dr DOUGLAS GUTHRIE showed a chart he had constructed illustrating age incidence. It showed the enormous number of cases among children under 1 year of age, the curious fall at the age of 4 and the rise at 5, probably due to the fact that school life had begun and the children being more carefully examined. Unsuspected cases of otitis were revealed. Why was otitis so common in infants? One reason was that when the child was born there remained in many cases the tissue which had filled the middle ear during embryonic life. This usually was absorbed but portions might remain in the corners of the tympanum and such embryonic tissue was very liable to infection. He had been relieved to hear from Dr Le Mée and also from Dr Ebbs that on incision of a suspected tympanic membrane one did not always find pus. Dr Le Mée had referred to what he called the frosted tympanic membrane dotted over with little grains. He had said that this was usually found in very young infants but the speaker had always regarded it as denoting a milder type of infection. Was Dr Le Mée's practice of carrying out the mastoid operation in infants in two stages due to fear of the anaesthetic or of the operation? He did not think x-rays of much value in mastoiditis in children. The skiagram would give the anatomical picture but diagnostically it was of little value and of no value at all, of course, unless the two sides were compared.

Mr ERIC WATSON WILLIAMS said that the first two years of life really supplied the bulk of cases. Dr Le Mée had said truly that otitis media meant infection of the whole middle-ear tract. It was important to keep in mind that there was no barrier dividing the tympanum from the mastoid. He stressed the need for quickness in the operation of myringotomy. His own rule was a minute a month. For a child 7 months old seven minutes from incision to stitches. Mr MCNAIR SCOTT mentioned the difficulty presented by cases of an upper respiratory infection with an ear that was red but with no indication of pain. A certain number of such cases would clear up; others would have to be opened. Was there any harm in opening a drum when one was not quite sure whether there was pus behind it in the absence of such symptoms as pain and sleeplessness?

Dr L. R. MITCHELL in reply to a question said that he did not use general anaesthesia when operating on infants. He put some ice behind the ear for five minutes, that was quite sufficient for a good local anaesthesia. The opening of the bone was not painful, only the cutting of the skin was felt.

INFLUENZAL MASTOIDITIS

A meeting of the Devon and Exeter Medico-Chirurgical Society was held on April 29, the president Dr R. H. NORMAN being in the chair. Mr CHARLES CARROLL read a paper prepared in association with Dr G. M. WHITCOMB on a case of acute mastoiditis in which meningitis and thrombosis of the lateral sinus had occurred as complications and Pfeiffer's bacillus had been the sole organism isolated.

A girl aged 5½ was admitted to hospital on March 17 with a large swelling of the right side of the face, about one week and more recently enlarged of the neck. The right tympanic

membrane was found to be injected and stiffness of the neck was pronounced. Paracentesis of the membrane on the following day produced blood but no evidence of pus. The cerebro-spinal fluid was found to be purulent with a leucocyte count of 8,860 per cmm, and *B. Pfeiffer* was recovered from cultures of this fluid. On March 20 the cerebral and constitutional symptoms having become progressively more grave, Schwartz's operation was undertaken and the middle fossa was exposed. Some pus was found in the cells but no extradural abscess. Lumbar puncture repeated at this stage yielded an opalescent fluid, it being noted at the time that no change in the flow was effected by pressure on the jugular veins. On April 1 despite the absence of any definite localizing sign the condition remained serious enough to warrant exploration of the lateral sinus on the right side. This was found to be full of pus, the natural appearance of the sinus having been obliterated by the effects of suppuration. Rapid improvement followed and it was possible to undertake an operation for repair of the large post-aural wound on April 15. On the day of the meeting the general condition of the patient was good and no trace of any meningeal symptoms remained.

Mr CARROLL stated that in addition to the surgical interventions tablets of prontosil album had been given throughout the patient's stay in hospital. It seemed impossible to ignore the influence of this drug in arresting the spread of the infection. In the discussion Dr W. A. ROBB said that a Pfeiffer meningitis constituted a very grave condition from which the authenticated cases of recovery were somewhere about 3 per cent. In this instance no haemolytic streptococci had been isolated and since Pfeiffer's bacillus was known to coexist with other organisms the possible explanation of the prontosil influence might be the breaking up of some symbiosis.

Severe Hypothyroidism

Dr CHARLES SEWARD read a short account of a case of toxic goitre in a woman aged 47.

Toxic symptoms had been present for some eight years and had been so severe three years previously as to limit the scope of the operation attempted at that period. Following that operation some degree of improvement had been maintained for about a year but since then there had been progressive deterioration. During the last few months palpitation and dyspnoea occurred with or without effort, the appetite had failed, there had been consequent loss in weight and the patient had complained of thirst, disturbance of sleep, tremor, irritability and a lachrymose tendency. A fortnight before admission the symptoms had culminated in those of congestive cardiac failure with resultant oedema extending up to the waist. When admitted to hospital early in April she was very thin, the eyes were staring, and there was visible pulsation in the carotids and jugulars. The thyroid was as large as half a lemon and was soft and smooth. Cardiac dilatation was obvious, the apex beat being 5½ inches from the mid line. Fibrillation was occurring up to a rate of 224, the pulse being estimated coincidentally at 200. The liver was enlarged and tender, its lower margin reaching to the level of the umbilicus. Treatment with digoxin (0.25 mg. given four hourly) and calyrgan (1 ccm daily for several days) was followed by a drop in the pulse rate and free diuresis. On the eighth day after admission iodine treatment was commenced, but was replaced by intravenous injections of sodium iodide owing to skin reactions. On the fourteenth day thyroidectomy had been performed by Mr NORMAN LOCK. Five days after the operation the pulse became regular at 80 and as observed at the meeting, there was a decided improvement in the general condition reported when the patient was admitted to hospital. The apex beat was now only 3½ inches from the mid line and the pulse was regular and well within the normal limits.

Mr NORMAN LOCK, commenting on this case, stated that when he was called in by Dr Seward to see the woman before her admission to hospital the pulse rate was so rapid as to be uncountable. He had never seen a case of such gravity. Immediately before the operation 15 grains of sodium iodide had been injected intravenously. Both lobes of the thyroid were enlarged and he had removed nine tenths of the gland. In reply to Dr MITCHELL he stated that he had avoided removing the para-thyroid, been saving a thin layer of the posterior aspect of the thyroid.

at the Victoria Hospital for Sick Children, Hull, during nine years. The cases numbered 599, and 249 of them were bilateral. Of these 185 were in children under 1 year of which 80 were bilateral, 200 were in children from 1 to 2 years, 86 being bilateral, and 214 were in children aged from 2 to 3 the bilateral cases numbering 83. Mastoid operation was required in 19 per cent of all the affected infants and in 26 per cent of the older children. The importance of the high incidence of bilateral involvement was that it indicated the necessity for examining both ears even when the mother had noted discharge or evidence of pain on one side only. Symptoms in the second ear might make themselves obvious several days or even two or three weeks after the first signs in the other ear. A common feature had been the coincidence of a pulmonary condition. The incidence of tuberculosis had been surprisingly low. It had not been possible to ask for a routine examination of *mastoid discharge* or of the products of the mastoid operation where such had been performed, as there was no pathologist attached to the hospital, and all work of that kind had to be paid for. Specimens had been sent, however, when the signs were at all suggestive. Even then the large majority of reports had been negative. As the cases which aroused suspicion were fewer than one in ten it followed that the estimate of the incidence of tuberculosis was under 5 per cent. This estimate might be compared with some of those mentioned when the subject was discussed in the Section in 1914, especially the figures from Edinburgh given by Turner and Fraser. Had the pure milk campaign made all this difference in less than a quarter of a century? It was true that in 1914 the incidence of tuberculosis in Edinburgh was accepted as being much higher than in most English towns. Moreover, the percentage of tuberculous cases in a series could be lowered by an increase of non-tuberculous cases as by a diminution of tuberculosis. With increased knowledge on the part of both parents and practitioners, and the stimulus of child welfare workers, a very much larger number of cases of the milder and more transitory type of otitis were now seen than was the case a generation ago. Further, it might be that non-tuberculous otitis media not only escaped attention less often but was actually more common. But allowing a sufficient discount for all these factors, the comfortable reflection might be made that this generation had witnessed a large diminution in the incidence of tuberculous otitis.

Findings at Necropsy

Dr J H EBBs of Birmingham reported on the post-mortem examination of the middle ear and mastoid antrum of 880 children, of whom 80 per cent were under 2 years of age. These were children who had died from all types of medical and surgical conditions. Purulent material in one or both ears was found in 52.8 per cent. Of the children who had died in their first year 62 per cent had otitis media though he was not implying that the children found with otitis media at necropsy had necessarily died as a direct result of that condition. An analysis also showed that 238 of the children under the age of 2 years had suffered from gastro-enteritis characterized by severe diarrhoea and vomiting. Of these 238 cases 193 had otitis media.

He added a few personal observations on the clinical aspects of this problem. He was often asked particularly by new residents how they were to diagnose the otitis media mastoiditis and sinusitis so often found in these cases at necropsy. They said this was quite simple in the cases which showed the classical signs and symptoms but unfortunately such conditions were rare particularly when there was gastro-enteritis. The more common finding was either a dull red or grey lustreless drum. On incision there might or might not be a discharge. The temperature charts of these children varied greatly. The high temperatures found were associated with the acute type of

otitis media. Some cases showed a low grade irregular temperature of about 99° to 100° F others a normal or subnormal temperature. He had observed from the charts of these cases that a great number of them showed their infection by a distinct rise in the pulse rate rather than by a rise in temperature. Very often these infants would go for a week or ten days with a temperature of 96° or 97° F, yet the point where the infection started could be picked up by a rise in the pulse rate from 140 to 160 or 170. Out of seventy six infants dying of meningitis other than tuberculous meningitis, fifty-eight had otitis media. Of the cases with meningococcal meningitis, twelve out of twenty had otitis media, of those with streptococcal meningitis twenty two out of twenty three, and of those with pneumococcal meningitis ten out of fourteen.

Finally with regard to prophylaxis, the first point was breast-feeding. Out of this large number of cases only two of the infants had been breast fed for any appreciable length of time. When they were breast fed they usually survived gastro-enteritis or pneumonia. The best insurance that a mother could give to her newborn child was to attempt to breast-feed it during the first few difficult months of life. It was difficult to impress upon adults the danger of exposing the infant to acute upper respiratory affections such as the common cold or influenza which they might be suffering from themselves. It must be apparent that there was a great field for co-operation between the paediatrician and the ear nose, and throat surgeon. He went on to make a few comments on general paediatric aspects.

Paracentesis

Mr W STIRK ADAMS of Birmingham showed a chart giving the number of times paracentesis was performed in the out patient department at the Children's Hospital in that city over a period of years. He had never seen a case of such gravity. Immediately before the operation 15 grains of sodium iodide had been injected intravenously. Both lobes of the thyroid were enlarged and he had removed nine tenths of the gland. In reply to Dr M Y PAGET he stated that he had avoided removing the parathyroid by conserving a thin layer of the posterior aspect of the thyroid.

Local News

ENGLAND AND WALES

District Medical Services in London

At the meeting of the London County Council on May 4 the district medical service in London was the subject of reports by the Hospitals and Medical Services and the Public Assistance Committees. In London the domiciliary medical service provided under public assistance is given by officers appointed for specified areas into which the county is divided for the purpose. About one third of the work is carried out by the staff of certain of the council hospitals and the remainder by general medical practitioners engaged on a part time basis. A conference has taken place between representatives of the Council and of the County Councils Association and the Association of Municipal Corporations to consider a Ministry of Health report on the various systems adopted by local authorities for the administration of their district medical services. These systems are principally three: the whole time system, in which officers are wholly engaged in district medical work or combine it with other duties in institutions or hospitals, the part-time system, under which general practitioners devote part of their time to district medical work in a definite area and receive a salary, and the open-choice system, which entails the appointment of a panel of local practitioners in a given area who are remunerated by the local authority on the basis of payment per person treated or at risk. The Ministry's report did not offer serious criticism of any of the foregoing methods, although it pointed out that the whole time and part time systems, the second of which was stated to be in force throughout the greater part of England and Wales, are less complicated and expensive than the third, which is of comparatively recent growth. It was the unanimous view of the conference that the report confirmed the need for local authorities to retain full discretion to administer their district medical services in such a manner as they considered best suited to the circumstances of their respective areas, and representations are being made to the Minister of Health in that sense. In London it is now proposed that the county medical officer of health shall be appointed district medical officer and delegate his duties as such to assistant medical officers who would be appointed as his deputies. The arrangement would be analogous to that which has operated for some years in the school medical service and it is considered that it would give the Council the control which it exercises in regard to practically all other staff engaged in connexion with hospitals and allied services and the necessary complete freedom to organize and administer the district medical service so as to secure the best results.

THE B.M.A. S VIEW

The British Medical Association which had already made representations now under consideration as to the method of administration of the district medical service has expressed no objection to the principle implied in the county medical officer of health becoming the district medical officer seeing that the present time may be regarded as transitional so far as the district medical service is concerned. It considers however that if the Council decides to adopt as its permanent method of organizing the district medical service that of appointing part-time general practitioners it is essential that means should be found for preserving the duties and privileges of such officers as set out in the Public Assistance Order 1930 particularly in relation to security of tenure. The Hospitals and Medical Services Committee however is not satisfied that a case has been made out for retaining the protection of the Public Assistance Order in regard to

officers engaged by the Council for the district medical service, or that the interests of the members of the community whom they serve will be in any way adversely affected by the arrangements proposed. Under the Public Assistance Order, from which, however, the Minister has power to sanction departure, the Council is required to appoint a district medical officer for every medical relief district, and such officers must be senior Poor Law officers who can only be dismissed or removed by the Minister of Health, but in 1933 the Council approved conditions of appointment of service for part time assistant medical officers (general practitioners), making all engagements of such officers on a temporary basis, and the Minister of Health has consented to that course. Therefore officers engaged in the district medical service since March, 1933, are on a temporary basis and are not senior Poor Law officers to whom the provisions of the Public Assistance Order would apply. Those district medical officers who have by virtue of prior appointment, the status of senior Poor Law Officers, will, of course, be outside the arrangement of delegation just referred to and will retain their status until they leave the service, but as vacancies occur the arrangement suggested whereby the county medical officer of health is district medical officer and delegates his duties to deputies will hold. It is considered that the Public Assistance Order contains provisions regarding appointment of district medical officers which limit the action of local authorities in the matter, other difficulties have also arisen in connexion with the Order and have prevented complete freedom in adopting the method considered best for the administration of the service.

Central Midwives Board

At the May meeting of the Central Midwives Board for England and Wales approval as lecturers was granted to Douglas Score Flew, M.D., M.C.O.G. at the Cullingworth Lecture Centre, Midwives Institute, and to Elsie Violet Crowe, M.B. F.R.C.S. at St. Alfeges Hospital, Greenwich. An application from the medical officer of health for Barking for approval of Upney Maternity Pavilion for the purpose of Rule E.2 was granted. A letter from the medical officer of health for Winchester asking for information as to the position of midwives with regard to post natal examinations, was considered, and it was agreed to reply: 'That the object of a post natal examination is to ascertain whether there is any medical or surgical condition which requires treatment or supervision. This being outside the province of a midwife, post-natal examination should only be conducted by a fully qualified medical practitioner.'

Smoke Abatement

The seventh annual report of the National Smoke Abatement Society includes a list of publications concerning the smoke nuisance, several of which are the work of medical men. Of particular interest is *Fumifugium or the Smoake of London Dissipated* by John Evelyn now republished by the society. This indictment of the smoke evil by the famous diarist was originally printed in 1661 by command of Charles II. The report states that the increasing public interest in the state of the atmosphere continues to be maintained and notes with satisfaction that more attention is being paid to this subject in the annual reports of medical officers of health and sanitary inspectors. At the society's conference at Bristol two resolutions were adopted: one congratulating the Manchester City Council on its measures to further the use of smokeless fuels, the other advocating the withdrawal of the qualified exemption enjoyed by certain industries under the Public Health (Smoke Abatement) Act 1926. A questionnaire bearing on this second resolution was sent to medical officers of health concerned with these industries and the replies received justified the drafting of a letter to the Ministry of Health suggesting the desirability of withdrawing the exemptions. The report records with regret the death of Mr R. Morton

Rowe, formerly chief smoke inspector to the City of Manchester Health Department, and for many years a member of the society's executive committee. The total income of the society from subscriptions and donations is less than £1,000, and the number of private subscriptions is surprisingly small. Membership forms are obtainable from the general secretary, National Smoke Abatement Society, 36, King Street, Manchester, 2. The minimum subscription for members (including journal) is 10s 6d per annum.

NEW ZEALAND

[FROM OUR CORRESPONDENT IN WELLINGTON]

THE PROBLEM OF ABORTION

The report has now been published of the special committee set up by the Government to inquire into various aspects of the problem of abortion in New Zealand. The investigations and conclusions of the committee are summarized as follows:

I The committee is convinced that the induction of abortion is exceedingly common in New Zealand, and that it has definitely increased in recent years. It has been estimated that at least one pregnancy in every five ends in abortion, in other words, that some 6,000 abortions occur in New Zealand every year. Of these it is believed that 4,000 at a conservative estimate are criminally induced either through the agency of criminal abortionists or by self-induction each of which is equally dangerous. It is clear that death from septic abortion occurs almost entirely in such cases. Such deaths have greatly increased in recent years and now constitute one-quarter of the total maternal mortality in some urban districts it amounts to nearly half of the total maternal mortality. New Zealand has according to comparative international statistics, one of the highest death rates from abortion in the world.

II The committee, after taking evidence from witnesses representing all sections of the community, has formed the conclusion that the main causes for this resort to abortion are (1) economic and domestic hardship, (2) changes in social and moral outlook, (3) pregnancy among the unmarried and (4) in a small proportion of cases fears of childbirth.

SOME SUGGESTED REMEDIES

III Consideration has been given to the possible remedying of these causes:

(a) In so far as economic hardship is the primary factor certain recommendations have been made regarding financial domestic, and obstetrical help by the State.

(b) To lessen any fear of childbirth where this exists, it has been recommended that the public should be informed that New Zealand now has a very low death rate in actual childbirth and that relief of pain in labour is largely used. At the same time the committee has advocated that further efforts in the direction of pain relief should be explored.

(c) For dealing with the problem of the unmarried mother the committee considers that the attack must be along the lines of more careful education of the young in matters of sex, prohibition of the advertisement and sale of contraceptives to the young and a more tolerant attitude on the part of society towards these girls and their children.

(d) The committee believes, however, that the most important cause of all is a change in the outlook of women which expresses itself in a demand of the right to limit—or avoid—the family coupled with a widespread half knowledge and use of birth-control methods—often ineffectual. These failing, the temptation to abortion follows.

CONTROL OF ABORTION

The committee can see only two directions in which abortion resulting from these tendencies can be controlled:

1 By the direction of birth-control knowledge through more responsible channels where while the methods would be more reliable the responsibilities and privileges of motherhood the advisability of self discipline in certain directions and other aspects of the matter would be discussed. The committee believes that it is through the agency of well informed doctors and to a certain extent through clinics associated with our hospitals, that this advice should be given. It is not however considered that this is a matter for the State except to a limited degree.

2 To appeal to the womanhood of New Zealand in so far as selfish and unworthy motives have entered into our family life to consider the grave physical and moral dangers not to speak of the dangers of race suicide which are involved.

This it is considered is a matter for all women's social organizations to take up seriously.

IV Certain further measures of a more general nature came under the examination of the committee. The prohibition of the promiscuous advertisement of contraceptives and of their sale to the young, the licensing of the importation of certain types of contraceptives, the restriction of the sale or distribution of contraceptives to practising chemists, doctors, hospitals, and clinics, the prohibition of the advertisement, or of the sale except on medical prescription, of certain drugs and appliances which might be used for abortion purposes—these measures are recommended.

THERAPEUTIC ABORTION

The specific legalization of therapeutic abortion (by doctors for health reasons) as a safeguard to doctors was fully examined but is not recommended. The committee is satisfied that the present interpretation of the law is such that, where the reasons for the operation are valid, the doctor runs no risk of prosecution. The risks of an alteration in the law are great.

Legalization of abortion for social and economic reasons was also put forward. The committee has discussed the matter, and strongly condemns any countenancing of this measure. Though it may be conceded that legalized performance of the operation by doctors in hospitals might reduce the incidence of surreptitious abortion and deaths from septic abortion, we do not accept this as any justification of a procedure which is associated with grave moral and physical dangers.

With regard to sterilization the committee adopts the same view as towards the specific legalization of therapeutic abortion. It is believed that where the reasons for the operation are in accord with generally accepted medical opinion there is no bar to its performance. We see, however, tendencies in the direction of extending this operation far beyond the bounds of this accepted medical opinion. For this reason we do not recommend any alteration in the present position.

The failure to obtain the conviction of the criminal abortionist even in cases where the guilt seems beyond all doubt has been discussed as a matter of serious concern, and the committee can only bring before the public its responsibility, as represented by members of juries, for the virtual encouragement of this evil practice.

Finally the committee, while fully conscious of its inability to put forward a complete and certain solution of this grave problem or one which will satisfy all shades of opinion, believes that a definite service will have been done through this investigation if full publicity is given to the facts of the situation as here revealed and if the public conscience is awakened to the fact that although State aid and legal prohibitions may do something to remove causes and to deter crime the ultimate issue rests with the attitude and action of the people themselves.

Since 1932 the incidence of diphtheria in Germany has more than doubled having risen from 64,138 or 9.9 per 10,000 inhabitants in 1932, to 149,971, or 22.4 per 10,000 in 1936.

Correspondence

Angina Innocens?

SIR,—The recent article by Dr Geoffrey Bourne (*Journal* April 3, p 695) and the correspondence which has followed prompt me to put forward an earnest plea for the abolition of the most unfortunate term "angina innocens", the synonyms "secondary angina" (Mackenzie) and "pseudo-angina" are equally disastrous. The symptom-complex described by Dr Bourne is very common, and easily recognized by the characteristic behaviour of the pain. I have nothing to add to his excellent description of it. In the vast majority of cases it is a purely psychoneurotic symptom, often a manifestation of an anxiety state and often associated with anxiety concerning heart disease. In some cases it is not primarily psychoneurotic, but occurs in connexion with a state of nervous debility secondary to a chronic toxæmia or infection. Thus it is found in patients with oral sepsis, with chronic infection of the urinary tract, with chronic cholecystitis, etc. and in such circumstances is curable by appropriate treatment of the sepsis, it is occasionally met with in the early stages of pulmonary tuberculosis, infective endocarditis, or other chronic infections, it is sometimes found with mild grades of thyrotoxicosis before any definite circulatory insufficiency or demonstrable organic cardiac change has appeared.

It is evident that in these circumstances it will occur frequently in persons whose cardiovascular systems are free from any suspicion of organic disease. It is equally evident that it may arise in persons who are the victims of an organic cardiac lesion and that in them it is not the result of the heart disease but of a superadded psychoneurotic or toxic factor. Its successful treatment depends on recognition of this fact. I have met with it not only in cases of mitral stenosis and other forms of valvular disease but even in cases of coronary disease where there has been a previous coronary thrombosis or a definite angina of effort as well. Where it complicates organic heart disease it may be toxic and curable by appropriate treatment but it is even more often psychoneurotic, dating from some definite psychological trauma accompanied by additional signs of nervous tension such as insomnia, tremors, exaggerated reflexes, and a pulse rate which is more rapid than the nature of the heart disease would appear to justify. In these latter cases treatment on psychotherapeutic lines will often remove the symptom-complex in question and though it leaves the symptoms due to the organic disease unaltered the patient's disability is usually greatly diminished in consequence.

Dr Bourne attempts to justify the use of the term "angina innocens" by laying stress on the qualifying "innocens". Now there is no doubt that whatever medical men may say or think about the word "angina" it is associated in the mind of the layman with the most serious of all forms of heart disease—inevitably leading to frequent severe attacks of pain and incapacity and to a sudden early death. During the whole of his lifetime the word "angina" has had this significance for the layman and no amount of stressing of a prefix or suffix in a few minutes conversation is going to alter this lifelong conviction. The doctor may say "angina innocens" but the anxious patient's reaction when he gets home is "I knew it—angina—the innocens is merely an attempt to soften the blow. He has sustained a further psychological trauma which is only likely to lead to perpetuation of his symptoms and incapacity."

It is rarely, if ever, necessary to give a name to the syndrome in talking to a patient—all that is required is to explain the mechanism of the pain, that it is not due to heart disease, and that recovery will occur. If we must have a name for use in discussing it among ourselves let us employ a term which emphasizes the non-cardiac causation of the syndrome, such as "precordial pain of nervous origin," or even the shorter and non-committal term "left inframammary pain"—I am, etc.,

Glasgow, May 8

ALBERT A FITZGERALD PEEL.

Technique in Knee-joint Operations

SIR—In the *Journal* of May 15 (p 1015) my friend Mr. Eric I. Lloyd describes a technique for opening the knee-joint which he claims "stops short of fussiness, and he gives an instance of what he calls "self-deception". While I cordially agree with his efforts to simplify surgical operations, I suggest that he might go still further in his efforts to reduce fussiness and to avoid self-deception.

Why, for example, prepare the whole limb from the toes to the groin? Most surgeons would agree that this is wiser than limiting the process to the operation area, but why stop there? Why not extend this cleansing to the rest of the body by telling the patient to have a hot bath and not to spare the soap? Is the painting of the skin with iodine anything more than a form of surgical "self-deception" and has it any other advantage than that of reassuring the surgeon's conscience as to the amount of skin that has been prepared? The fact that the ordinary operation for an abdominal emergency heals so promptly appears to indicate that a prolonged preparation of the skin with methylated spirit is not only unnecessary but may damage its resistance. I used to tell my students that any surgeon who strictly observed the Lane technique and would keep his fingers out of the wound, could open my knee without any special preparation. I can repeat this challenge now with even more assurance for owing to the lapse of years, I am exceedingly unlikely to tear a cartilage.

I retain a very clear mental picture of Sir Arbuthnot Lane operating on the knee joint with impunity some forty years ago: his results even then surprised his colleagues and their success undoubtedly depended on the knife and fork technique for gloves had not come into their own by then. I have long been sceptical as to the infection of operation wounds from foci of hidden sepsis and I hint to Mr. Eric Lloyd that this may be yet another instance of surgical self-deception. In some 200 cases of removal of the internal meniscus I own to having neglected any preliminary care of the patient's teeth, and any success that I may have had I attribute to my having had the privilege of being house surgeon to Sir Arbuthnot Lane. No surgeon would deny that too much care cannot be taken in the preliminary care of operation cases but hidden sepsis should not be used as a scapegoat.

After such a "rough and robustious onset" it is a genuine pleasure to find myself at one with Mr. Eric Lloyd in his castigation of another self-deception, it is probable that the use of tetra-cloths to cover the edges of the wound is again a form of surgical mesmerism. It is a relic of the surgical ritual invented and practised by an amazingly gifted surgeon. Surely the definition of ritual as a prescribed manner of performing divine service shows quite clearly that it can hold no permanent place in future surgery—I am, etc.,

Sheffield May 16

GRAHAM SIMPSON

Treatment of Pharyngeal Carcinoma

SIR—We are indebted to Mr H S Souttar (*Journal* May 1, p 909) for calling attention to this method. It is attractive and relatively simple to carry out, but I am afraid I cannot share his optimism as to the results to be expected. This method has been in use in the Radium Clinic of the General Hospital for the last five years, and frequently referred to in the annual reports to the Radium Research Council.

There are two aspects which are unsatisfactory. In the first place, we have not been able to cure a single case by this method. The immediate results are gratifying and hopeful, the growth recedes, becomes less vascular, and swallowing is improved, but subsequent doses of radium are ineffective and the end result is death. We have, therefore, reluctantly come to the conclusion that neoplasm of the pharynx is relatively radio insensitive. In the second place, and of minor importance, is the fact that the scars heal badly. The wound has to be reopened and resutured at the end of a week, and this is not conducive to good scar formation. The presence of radium or radon deep in the wound has a retarding influence on healing.

I believe that the only real hope of cure at the present time is by following where it is possible, the drastic surgical technique so brilliantly designed and carried out by Wilfred Trotter—I am, etc.,

MUSGRAVE WOODMAN

Present-day Methods of Sterilizing Dressings

SIR,—The article by Major S N Hayes in the *Journal* of May 1 (p 911) is interesting, as it shows that research is still being done on a subject that was much discussed in the eighties of the last century. Having retired from active work some years ago my full notes of the relevant literature have long been lost, but as the designer of a sterilizing apparatus of which the Government made large use during the war I can still remember some of the data for anyone desiring to make or test such apparatus. Surgeons can hardly be expected to be able to design such auxiliary apparatus, and it is unfortunate if, as Major Hayes shows, those in current use are not entirely reliable.

Disinfectors often called stoves are large machines for sterilizing clothing, bedding, etc. while sterilizers used by surgeons are small machines on the same principle for sterilizing dressings, etc. Design to be successful depends on the following facts. Heated air is not a reliable sterilizer until a temperature of 138° to 141° C. is reached and at that temperature some textiles are apt to char. Fraser's ovens were at one time largely used and I can remember a set of such ovens in Leeds, discarded about 1889 in favour of steam disinfectors. Superheated or dry steam is much like air and does not sterilize except at unduly high temperatures. Saturated or wet steam is steam at any temperature corresponding to its pressure which condenses as soon as it impinges on a cooler object. In doing so it parts with its latent heat, and this was considered the reason why it possessed a powerful sterilizing action. Air being a bad conductor of heat bundles of textiles charged with it require much time for heat to penetrate to the centre and moreover unless the trapped air is got rid of tests of bactericidal action are apt to give anomalous results. This fact explains many of the contradictory opinions expressed by different research workers. A test should always be applied to show that all air has been expelled from the sterilizing chamber and that the articles under observation are really exposed to steam and not to heated air or for that matter superheated steam. Air being heavier than steam is easily displaced if steam be admitted gently at the top of the sterilizing chamber and an opening be provided at the bottom for the exit of displaced air. Directions for working a steam disinfecter generally stipulate

that articles to be disinfected should be hung loosely in the chamber but most sterilizers of dressings seem to be designed to trap as much air as possible.

Current steam at low pressure is a good sterilizer, but Delepine showed that to secure effective sterilization the rate of the current had to be so rapid that very large quantities of steam were necessary and a boiler or generator to produce so much steam is too cumbersome for practical use. For information the writings of the following amongst many others may be consulted: Koch (1881), Heydenreich (1885), Globig Kitt, Miquel Budde and Pfuhl, Frosch and Clarenbach, Salomonsen and Levison, Thoinot, Kremer, but Professor Delepine in articles in the *Journal of State Medicine* (1890) and Wolf Defries in *Public Health* supply much useful information which explains many of the discrepancies in the results obtained by other observers. The presence of air when they thought they were dealing with steam, was the chief stumbling-block in the past and my main object in writing this letter is to prevent present-day observers falling into the same confusion.

Major Hayes says that 'perfect sterilization should be simple. It merely consists in subjecting every part of the dressing to a certain temperature for a definite period. This is doubtful, as 'perfect sterilization' also depends on the medium in which the dressing is placed, whether air, superheated steam, or saturated steam. He refers to the varied times in which steam penetrates dressings, which may depend largely on how much air they happen to contain. Steam will penetrate rapidly if it can get in but if the dressings are charged with air the time taken to reach any particular temperature depends on how rapidly the air may conduct the heat from the steam.

Further on he writes that 'the contained moisture and air are driven off by heat or by the creation of a vacuum'. Now heating moisture and air does not drive it off, it simply makes it hotter. The driving off depends on the relative density of the surrounding medium, and steam is lighter than heated air. The creation of a perfect vacuum is one of the most difficult, if not impossible, feats in Nature. In any partial vacuum which we can produce in practice some air is bound to be left, according to Boyle's law.

Major Hayes mentions designing an electric thermometer as a control and I believe I have one lying about somewhere which must be forty years old. He says it provides absolute safety and checks the efficiency of the sterilizer. It really only shows when the inside of a dressings-container has reached the temperature of 115° C, but if that container has air in it at a temperature of 138° C would be necessary for sterilization, at which temperature the dressings would possibly be spoiled. Later he remarks that it is clear that steam is not a powerful penetrator. In my experience saturated steam is a powerful penetrator and a rapid one if air can get away and the steam reach the material in the container. In one paragraph he writes: 'The large majority of sterilizers, however use dry, saturated, or moist steam, and even when superheated steam is available the degree of superheat is not high.' Now what does that mean? Dry steam is superheated steam, and saturated steam is moist steam.

Mr Wolf Defries, being an engineer by profession was the first research worker to pay full attention to the physical properties of steam and his disinfecter was the first in which the necessary physical principles were applied. Containers for dressings are a great difficulty in securing reliable sterilization and it would be well if bacteriologists could design a technique by which dressings were sterilized in a loose condition and afterwards packed in sterilized containers—I am, etc.

Hove Sussex, May 3.

M J OLIVER, M.B., D.P.H.

Value of Liver Extract

SIR—With regard to the recent correspondence about the efficiency of certain forms of parenteral liver treatment for pernicious anaemia, especially the Dakin and West fraction 'anahaemin' (*Journal*, April 3, p 730) we should like to put on record the following untreated severe case of pernicious anaemia

A woman, aged 43, who was sent in with a diagnosis of 'chronic nephritis and anaemia', was examined on April 12, 1937, and was found to have an extreme lemon yellow tint with enlargement of liver and spleen. The blood count was as follows: red blood cells 720 000, haemoglobin 15 per cent, measurement by Eves' haemocytometer 8.6. Two ccm anahaemin were injected on April 12 and again on April 14. Further injections of 1 ccm anahaemin were given on April 26 and on May 6. Changes in the blood picture were as follows:

April 13	Reticulocytes	1.56 per cent	
" 14	"	2.62	"
" 15	"	2.1	"
" 16	"	1.82	"
" 17	"	6.0	"
" 18	"	23.8	"
" 19	"	45.3	"
" 20	"	24.8	"
" 21	"	16	"
" 26	Red blood cells	1 150 000	haemoglobin 25 per cent.
" 3	"	2 025 000	45
May 3	"	2 460 000	55
" 10	"	2 700 000	63

A subsequent test meal showed complete achlorhydria. Until recently, we should undoubtedly have transfused this patient before treating her with liver extract, but similar experience with two other severe cases treated with anahaemin have given us sufficient confidence to wait for the expected reticulocyte crisis about the fifth day.

—We are, etc,

Blood Transfusion in Obstetrics

SIR—I quite agree with Mr R. Rutherford's suggestion that the gravity method of blood transfusion is obsolete (*Journal* May 8, p 996). I also feel that more accidents come from too rapid transfusion than from the more recognized factor of faulty grouping.

I have never used so small a needle as Mr Rutherford recommends, but I find that a gauge 12 imposes much strain on the operator's thumb and forefinger, and imagine that a gauge 17 would make this most unpleasant. Further, with the 12 size I find leakage between barrel and piston inevitable in the best syringe after three or four transfusions. I daresay this annoyance would be worse with the finer needle. Using the 12 gauge needle I have observed on occasion a mild local thickening of the vein which makes it useless for about three weeks. With a larger serum needle I have not met this difficulty. I ascribe this to the force with which the jet of blood strikes the intima and should be interested to hear if others have had this experience. To my mind this is a further point in favour of the larger needle. With self-control the blood will not be given too quickly, and if the patient is so collapsed that a No. 1 serum needle cannot be introduced it is probably best to expose a vein—I am, etc,

London SW4 May 9

GAVIN THURSTON

SIR—Dr Norman Black's survey of blood transfusion in obstetrics (*Journal* May 1) has been a valuable contribution, but as Mr Wentworth Taylor (May 15) points out many cases of post partum haemorrhage are avoidable. Excluding cases in which general ill health and

chronic uterine subinvolution are predisposing causes, prolonged and difficult labour, too free use of unsuitable anaesthetics such as chloroform, and, most important of all, faulty management of the third stage are usually avoidable.

It is disheartening to find so many attendants—midwives and doctors—"grasping and kneading the uterus." The hand 'controlling' the uterus cannot resist that fatal reflex kneading with resultant incomplete recovery of uterine tone and irregular and unnatural separation of the placenta. I would almost suggest that the Central Midwives Board supply each midwife with a twenty minute "hour glass" by which to work. As to replacing the fluid loss, the primary intravenous infusion of a gum saline solution (such as the ampoule supplied by Messrs Evans Son Lescher and Webb, Ltd) made up to 250 ccm with sterile water, administered through a Jubay syringe is a great standby pending the organizing of a blood transfusion. I have tried Dr William Hunter's solution used at Newcastle—namely, ephedrine HCl 1 grain, glucose 440 grains, gum acacia 525 grains aq. dest. up to 1 pint—and although it is dramatically effective for the first quarter of an hour following infusion the subsequent fall in blood pressure has in two cases been a serious after-effect.

To organize a blood transfusion service in a wide rural and industrial area is not so easy as it is in a large city. I have a voluntary corps of forty-five donors for midwifery cases spread all over a county, and it is essential to give an exsanguinated patient some blood volume replacement pending the comparatively long period that must elapse before a donor arrives. As in every blood transfusion a direct agglutination test is essential this again means more delay. The separation of the recipient's serum, combined with the very essential wait of at least five minutes to ensure non-agglutination with the donor's red cells unfortunately all take time.

There appears to be far more place for blood transfusion in obstetrics than is generally accepted. We are too used to being satisfied with an exsanguinated patient left with a rapid pulse after the completion of labour. Slight infection in an exsanguinated patient may become a tragedy, and in any case it takes months for such a patient to regain her normal health. When once pathologists have found some way of conserving donor bloods in ampoules transfusion should be as easy after a direct agglutination test as any other intravenous administration. That obstetrics is recovering from its primary inertia in its relation to the replacement of blood loss should mean far less maternal morbidity in the future—I am, etc,

Rossett Denbighshire May 17

R. OWEN JONES

The Maternal Mortality Report

SIR—There are some observations in the *British Medical Journal* of May 8 dealing with the recently issued maternal mortality report upon which, with your permission, I should like to comment.

In the leading article on page 978 col. 1, line 20 et seq. it is stated that the Ministry of Health and the Central Midwives Board have under consideration a proposal that a midwife should be allowed to call to her assistance such practitioners only as are selected by the local authority for this purpose. This statement is hardly correct, and if one turns to the memorandum in the *Supplement* on page 270 col. 2 para. 10 the exact recommendation will be found as follows: "The local supervising authority in consultation with the local medical profession should in future be empowered to take steps to ensure

that the best local obstetrical skill is made available in all cases in which midwives are required under the Rules of the Central Midwives Board to call in a doctor.' It seems to me that the inclusion in the recommendation of the local medical profession is a matter of great importance, and it is unfortunate that your leading article has omitted to refer to it. Quite obviously, if the best local obstetric skill is to be made available for mothers when emergencies arise, some plan must be adopted. It is equally clear that the local supervising authority as the body ultimately responsible for payment to medical practitioners for attendance in such cases must undertake the duty of formulating such a plan. This duty is bound to be a difficult, and it may be a disagreeable, one, and it is certain that local supervising authorities generally will desire the fullest information, advice, and co-operation from the local medical profession in whatever steps they take. In any case, in an important matter such as this it can be presumed that adequate safeguards will be introduced, giving the central authority power to deal with all points in dispute.

The recommendation referred to, so far as I understand it, envisages a friendly consultation between practitioners and the local supervising authority, whereby a panel of doctors would be formed from which a choice would be made. It is true that the choice might be limited, but it would only be so limited when the necessities of the case required it, and then only by a small fraction. If certain names were not placed on the panel because either the doctors themselves did not desire it, or their fellows and the local supervising authority did not think it desirable, the mother or midwife would still have a free choice of all the other doctors on the list. This follows closely the procedure under National Health Insurance, for in no area does the panel in this scheme embrace all the practitioners in it. The medical profession do desire that the best obstetric experience should be available for child-bearing women when an emergency arises and I am certain that local practitioners can be relied upon to recommend only those of their fellows whose experience and knowledge justify their inclusion in the list.

The assumption that if this recommendation was implemented the Medical Act would have to be amended goes a great deal too far, as no suggestion is made in the maternal mortality report which would imply any interference with the statutory rights of the doctor. It did not require an amendment of the Medical Act to set up a panel of doctors whom Insurance Committees would pay for their services to insured persons when sick, so also it will not require an amendment of the Medical Act to enable a panel of doctors being set up whom local supervising authorities will pay when emergencies arise in midwives cases. These authorities already employ midwives under the Midwives Act of last year and it is surely their duty to see that the midwives have efficient medical assistance when they require it.

The further assumption that newly qualified doctors are to be denied the major portion of the opportunity open to them for acquiring such experience cannot be justified by reference to the maternal mortality report. It is true that in the body of the report it is suggested (page 229) that only those practitioners who show special interest in and have considerable practical experience of midwifery should be called to the assistance of the midwife. This is a valuable suggestion and I do not gather that the author of the article referred to would wish mothers to be attended in emergencies by any who do not comply with this requirement. The General Medical

Council has tightened up the training of medical students so far as midwifery is concerned, but it cannot be claimed that even the present-day medical students are experienced in midwifery and possess the best obstetric skill. But even so, the recommendation in the maternal mortality report does not suggest that young doctors should be denied the right of being called in to assist midwives. It leaves it entirely to the committee of local practitioners and the local supervising authority to decide what names are to be placed on the panel, and if this committee were of opinion that some newly qualified doctor was a proper person to be placed on the panel the committee would so place him, and he would be available to be called in by any midwife in the area if the mother so desired.

The report seems to me to be a moderately expressed statement of a position already well known to many members of the medical profession, which as a whole has welcomed all attempts to improve the standards of its practice and as a whole has never suffered thereby—I am, etc.,

Town Hall Bradford
Yorkshire May 14

JOHN J BUCHAN

Air Raid Precautions

SIR—It is no longer correct, I find, to think of our work as one of healing. I learn from the Home Office Instructor on Air Raid Precautions in the Birmingham area that my duties in the next war are to aid the police in preventing panic to reassure the gas casualties, to get it into people's heads that 'whether they have gas-proofed rooms or not the important thing is for them to be under cover in their own houses,' that the whole danger of gas attacks lies in the lowering of national morale and that the medical profession, as a group of persons 'who can speak with authority, is to maintain that morale, in which function the Home Office considers them of only less importance than the police.'

These actual quotations from a lecture are no misrepresentation of the general tenor. Having heard pacifists maintain that the main object of the Government's air raid precautions scheme was a military one—that is to make panic or any mass protest against the continuation of war less likely, and that protection from death and injury in air raids on cities was only possible by the erection of bomb proof shelters which the Government considered too expensive to contemplate—I attended this official lecture, delivered by a doctor to other doctors on the invitation of the British Medical Association in order to learn what attitude was taken by the Home Office officials themselves. I was prepared to hear the lecturer say that with the Prime Minister he acknowledged that nothing like protection to a city population was possible short of bomb proof and gas proof shelters constructed for the purpose but that until the Government had made its plans the possibility of sudden air attack on cities existed and that the Air Raid Precautions Department offered some advice as better than none that a few lives might be saved by such advice and that he was there to tell us how we could help in this limited sense. Such an approach to the question would have had my full sympathy and co-operation.

The lecturer opened by assuring us that he had no connexion with the fighting services, the Air Raid Precautions Department had nothing warlike about it and was intended purely for the passive protection of the civil population. He told us that it would require anything from a few inches to several feet of concrete to protect buildings from air raids, and that "nobody had

suggested that it was possible to protect the whole population in this way.' He went on to describe how we might advise people to erect on scaffolding three layers of filled sandbags on their roofs, with two feet interval between the layers, to protect them from splinters from high explosives. No enemy, he continued, would use gas bombs only, high explosives would first be used to demolish important centres like railway stations, public buildings—including hospitals, which would become too dangerous to be used for other purposes than as casualty clearing stations—and generally to do as much damage to structure as possible. Thermite bombs would follow in thousands with the aim of starting a general conflagration in the city beyond the powers of the fire brigades to deal with. Gas would next be sent down by spray or bomb, and it was then that doctors and first-aid services would be needed to 'prevent panic, to reassure' those affected, and to persuade people to remain in their houses. A passing mention was made of the difficulties of protecting the aged and children and invalids, but respirators 'were a second line of defence' and the main thing was that people should stay indoors. No mention was made of the impossibility for most working class families of providing a room for gas proofing (a room rendered uninhabitable because of boarded windows and blocked ventilators or chimney), and although the lecturer said that the modern bombing plane could aim accurately to within seventy-five yards no mention was made of the certainty that windows and gas-proofing would certainly be destroyed over a wide area surrounding the fall of a high explosive torpedo.

No opportunity was given for questions or discussion, and one is therefore unable to say how far the audience of some thirty doctors accepted the role indicated to them of persuading their neighbours that the Air Raid Precautions Scheme could really save them and their children when it must be perfectly obvious to the meanest intelligence that it can do nothing of the sort, and that the whole apparatus of the scheme is designed to deceive people into thinking that it will. I am not accusing the lecturer of deception: he was painfully honest. It is obviously much more satisfactory, from a military point of view, that people should die quietly in their homes than that they should run about the streets and possibly mob Cabinet Ministers: they might even, fearing retaliation, try to persuade our own airmen from their efforts to destroy French, German, Italian, or Russian cities. But I should judge that the audience was almost entirely uncritical, accepting war as inevitable and their duty that outlined by the lecturer. The lecturer, by the way, inadvertently said these will be your duties, but corrected himself and hoped we might avoid seeing the actuality. I put it to one member of the audience after the lecture that we were being asked to perform a military duty and to help deceive people into thinking that protection was possible on the lines proposed in order that mass protest against war should be made less likely. His reply was that if an enemy attacked us in this way we might as well make it possible for our Air Force to do the same to his cities.

I should personally be sympathetic to any Government which if it thought that the risk of war could not be avoided sought power to tax the people to the utmost limit to provide them with protection, putting the facts in an unvarnished way before them and placing the responsibility upon them. But I hold that our people have the democratic right of deciding for themselves now in time of peace whether modern warfare can justify itself by having none of the facts hidden from them. I call the

Government's Air Raid Precautions Scheme wilful deception of the people. I believe also that it is a deception which will defeat its own object. Panic is a mild word for the wrath which the people, rudely enlightened by the first English *Guernica*, will display against their rulers and officials when they survey the ruins and the dead—I am, etc,

Medical Peace Campaign

SIR—The death in early April of Dr Cecile Booyesen the secretary of the Medical Peace Campaign has been a great loss to her colleagues. It was chiefly through her inspiration and energy that the work of such a campaign was conceived and initiated. As we, who were closely associated with her, interpret her thought it was that our profession has a duty to strive for the prevention of all human suffering and pain by penetrating to their causes and removing them. If war came to be outside the medical purview one of the main sources of such suffering would be eliminated. A calm scientific approach is needed and the profession as a whole should be urged constantly to debate the problems associated with war and its causation much as it debates the aetiology and prevention of disease.

It is in this spirit that her work will be carried forward. We do not anticipate spectacular results, for the point of view will require discussion among our colleagues before it is likely to receive full acceptance. But primarily it is this discussion that we wish to initiate and foster.

An account of the activities of the campaign up to date will be found in the three bulletins that have so far been issued, but we feel that our activities are only beginning. We hope soon to issue a short book on the causes and characteristics of war as considered from a strictly medical point of view. Suggestions on possible research will be welcome, as will any other proposals for furthering the objects of the campaign.

Finally, we express our hope that all members of our profession who are convinced of the urgency of action will place themselves in some relation with the existing peace organizations such as the peace councils and the branches of the League of Nations Union—I am, etc,

JOHN A. RYLE
May 17 President Medical Peace Campaign

Birching of Children

SIR—Corporal punishment in any form should probably only be administered deliberately under conditions when the administrator can truly assert 'This pains me more than it pains you.' The occasions for its use will therefore be infrequent, and when the administrator is a judicial authority and the victim a child such a condition certainly never occurs.

Birching appears to be the expression of magisterial exasperation at being faced with the unfair responsibility of having to give some kind of guidance to a child whose own parents probably have failed it and who while still under the influence of such parents or guardians, has not responded to milder measures. At the same time no expert help is available for the bench in dealing with the psychological problem. Theoretically psychological help is available but in practice the number of trained child psychologists medical or lay is so small—and they have already so much to do—that such help is not readily available and so in fact in many cases its value and

even the possibility of obtaining it is apt to be overlooked

Another factor also contributes something towards such help being sought reluctantly. That is the tendency of the psychological experts to consider the child's problems and expect to dictate to the magistrates as to the disposal of the case. The part played by the psychologist is a limited one. It consists in determining what treatment is likely to produce a social and co-operative attitude in the individual offender. The court, though primarily concerned with the same problem, must consider also other aspects to some extent. The experts part must be limited to giving advice which the court has the responsibility of accepting, modifying, or rejecting entirely. If this were clearly understood and the position accepted, the courts would, I think, more readily be prepared to call for expert assistance, and if, as a result of experience, it was found that the advice tendered was good, undoubtedly it would be put to good use.

It avails little for experts to assert that magisterial birching should be prohibited in any circumstances. This amounts to a criticism of a body of individuals who deserve well of their fellows but who act, I believe, unwisely in inflicting such punishment as birching under any conditions, but it should not be impossible to ensure that in every case where a sentence of birching is contemplated the offender should be remanded for a psychological investigation and report both as to his condition and as to the possible lines of treatment that might be adopted. Under these circumstances I believe that judicial birchings would very rapidly become a thing of the past—I am, etc.,

W J T KIMBER
Medical Director

St Albans Nerve Clinic May 10

SIR—I hold no brief for or against whipping, but desire a tolerant view and recognition of the folly of dogmatism.

Dr G W Garde (*Journal* May 8, p 998) says 'that a very large element of sadism is responsible' for the advocacy of whipping. The *New English Dictionary* defines sadism as a form of sexual perversion marked by a love of cruelty. Then he expresses surprise that few psychologists have contributed to the discussions on whipping in this *Journal*. Also, among other things he states 'Psychologists are universally agreed that no child should be whipped'.

The task of mental science is to trace to its origin the kink which leads to odd or anti social behaviour and to suggest a remedy, but homely psychological lessons can be drawn from everyday life by anybody. As an instance a child promises not to play with the fire but conscience fails to restrain it, and automatically painful punishment ensues which has a powerful and permanent deterrent effect to the infant and to others knowing it. *Punch* in a cartoon once gave another example: a child is told that if he is naughty again he will be punished and he inquires which form it will take—be put to bed or beaten?

Mr Rudyard Kipling discussing this matter many years ago gave it as his opinion that many of the child problems could be solved with the slipper. Was Dr Richard Busby able to boast that sixteen pupils were on the bench of bishops due to his habit of birching or in spite of it? The old theological brimstone is seldom smelt now in ethical teaching but reward and punishment for good and evil is still upheld. In animal life the young are licked into shape: many human delinquents have much the same quality of conscience and bodily pain makes the only appeal.

To whip or not to whip, that is the question to be answered by an informed intelligence without prejudice in each case—I am, etc.,

Southampton, May 9

ARTHUR KING

SIR—I am in entire agreement with Dr G W Garde (*Journal* May 8, p 998) that whipping can never do any good and often does much harm. Unfortunately there are still a certain number of angry-looking old gentlemen both in the House of Lords and on the magistrates' bench who think that every form of juvenile delinquency is best treated by a dashed good thrashing, by gad, Sir! All psychologists are agreed that sadism is responsible for corporal punishment, however much the parent, teacher, magistrate, or whoever is concerned, may deceive himself. The fact of the matter is that whipping is a survival of a barbarous age, and our descendants will look upon the idea of inflicting pain on the body in order to train the mind much as we look upon the idea of burning men's bodies to save their souls.

It is a significant fact that, whereas corporal punishment is a traditional feature of English schools, it is almost unknown in most Continental ones. Charles Reade, author of *The Cloister and the Hearth* in referring to the immoderate thrashings he received at school said, 'It was supposed to make men of us. I only wonder it did not make devils of us.' So far as schools are concerned the most outrageous fact of all is that prefects are often given the right to cane. I should like to hear the view of a competent psychologist on the idea of allowing an adolescent, in the state of emotional and sexual instability peculiar to that age, to indulge in sadistic practices at his own sweet pleasure—I am, etc.,

Hove Sussex May 9

W N MAPLE

Recovery from Severe Syphilis without Medicine

SIR,—When I was a medical student at University College Hospital I apparently infected my left eye with syphilis from some out-patient, for I suffered for two or three weeks from what must have been a hard chancre on the lower lid, but in my ignorance I did not consult any of the staff. This was soon followed by a very hard gland at the left socket of the lower jaw about the size of a child's marble. A few weeks afterwards I had a very severe sore throat and a glandular swelling below the right half of the lower jaw about the size of a hen's egg. I consulted Sir William Gowers, but omitted to mention the previous eye trouble, as in my ignorance I saw no connexion between the two. He diagnosed hospitalism and overwork, and sent me home for three months. My brother, Professor Rushton Parker, took me to Mr Fred Lowndes, the Liverpool police surgeon, who diagnosed syphilis, at which I scoffed, as I had never exposed myself to such infection in the ordinary way, and had forgotten about my eye trouble.

After qualifying M.B. I spent a year as house physician in each of two Liverpool hospitals, in both of which I had continuous bad health, my throat looking like the interior of a cardiac ventricle with its muscular papillae, chordae tendineae, etc. A string of glands could be felt behind the neck, and I was becoming gradually deaf in the left ear. I therefore took two years travelling in Australia and New Zealand and across USA under the impression that I was merely suffering from overwork. As this had not the desired effect on my return I consulted Sir James Paget (who diagnosed tuberculosis of the throat). Sir Jonathan Hutchinson (who diagnosed either lupus or syphilis, but eventually, finding a minute per-

foration of the soft palate through which he could pass a probe, pronounced positively for syphilis), and Sir Morell Mackenzie (who told me not to worry about the diagnosis but to come daily to his house for eight weeks, by which time he would promise to cure) Sir Morell cauterized my throat every day (Sundays and weekdays) for eight weeks, at the end of which time I was quite well except for the complete deafness of the left ear. But he also prescribed 10 grains of iodide of potassium thrice daily, which I never took after a very few days, partly because they had a depressing effect but chiefly because I still obstinately declined to acknowledge that I could have syphilis which I guessed he had secretly diagnosed.

I did not suffer from any eruptions on the skin, nor did I lose any hair but several others besides those mentioned positively diagnosed syphilis so that one has to choose between an unusual case of severe syphilis and some other infection that could mislead some of the highest authorities. I am now in my eighty fourth year, and for half a century have enjoyed excellent health—I am, etc.,

WM. RUSHTON PARKER, M.A., M.D.

London W1 May 8

Osteochondritis Dissecans

SIR—I think many surgeons will be surprised by the views put forward by Drs Stevenson and Henderson in their article on osteochondritis dissecans in the *Journal* of May 8 (p 963). The authors suggest that this condition is brought about by an upset of the calcium metabolism of the body. They quote in support of their claim the case of a boy in whom a loose body of the elbow was found. They state that the radiographs revealed a general decalcification and that the blood chemistry showed an upset of the calcium balance. They feel that the cause of osteochondritis dissecans is a decalcification of the bones, in which condition trivial injuries may cause loose bodies.

I think most orthopaedic surgeons will disagree with this view, and I feel that the case reported by the authors does not prove their theory. The accepted view of the causation of osteochondritis dissecans is that it is undoubtedly due to trauma, which causes bruising of the articular cartilage with later exfoliation, usually in adolescents but always in perfectly healthy persons who have otherwise normal bones and a normal blood chemistry. These facts are fully expounded in the article on the subject in the *British Journal of Surgery* (1933) by H A T Fairbank. Further, to-day, Mr Timbrell Fisher tells me that he still adheres to the view of its causation as put forward by him in his book *Internal Derangements of the Knee Joint*—namely that articular cartilage easily bruises and that a relatively trivial injury such as slight hitting of the tibial spine against the cartilage of the condyle of the femur or a squeezing action as in rotation abduction movements of the elbow may be sufficient to produce a shearing strain which cleaves the layers of the articular cartilage or its underlying cancellous bone. He found also that the flaked piece of cartilage presented no change in its microscopical appearance or calcium content. The article by Mr Fairbank contains many excellent radiographs as also does the article quoted by Dr King in the *Journal of Bone and Joint Surgery* (1932). Again I have looked through the *Proceedings* of the Royal Society of Medicine and have seen the radiographs of several cases shown during the last few years and I submit that in none of these is there any evidence of decalcification either in the bones involved or in the other bones.

Drs Stevenson and Henderson declare that the bones are deprived of calcium, I admit that in the radiograph of their case these are rarefied but I suggest that another causation for this must be sought—acute traumatic or disuse decalcification may be other factors.

The authors are apparently endeavouring to lump together osteochondritis dissecans and osteochondritis. The former is a misnomer for a purely traumatic process affecting normal cartilage while the latter is a dysplasia of growing epiphyseal cartilage which is characterized by variations in the local calcium content, this possibly may be in some way related to a metabolic disorder. This point, however, is on a different matter—I am, etc.

London W1 May 10

G O TIPPETT FRCS

Obituary

S A KINNIER WILSON, M.D.,

D.Sc., FRCP

Physician to the National Hospital, Queen Square and to King's College Hospital

Dr Kinnier Wilson, whose death on May 12 after a short illness we regret to announce, was a neurologist of world wide reputation. He was physician to King's College Hospital, and to the National Hospital, Queen Square, for Nervous Diseases, and consulting physician to the London County Council.

Born in New Jersey, Samuel Alexander Kinnier Wilson received his education at Edinburgh University, where he took the degrees of M.A., D.Sc., and M.D. After graduating in medicine in 1902 he was house physician to Sir Byrom Bramwell whose enthusiasm for neurology turned Kinnier Wilson's interest into the same channels. He then went to the Salpêtrière in Paris, at that time the Mecca of neurology. Charcot was dead but his tradition was being ably carried on by Pierre Marie aided by Babinski and many others whose names are familiar to all neurologists. This teaching and environment kindled his enthusiasm and moulded his outlook on neurology. He also visited

Leipzig and returned from his *wanderjahre* with a fluent knowledge of French and German, which was a great asset in his later work. Thereafter his life was bound up with neurology and the National Hospital, Queen Square where he passed from house physician to registrar, pathologist and honorary physician. He was for a time assistant physician at the Westminster Hospital and later became physician and neurologist to King's College Hospital. At the National Hospital he came under the influence of Hughlings Jackson whose philosophy of approach to neurology greatly attracted his young disciple.

Fame came early to him from his discovery of the disease which he called progressive lenticular degeneration but which has always been known as Wilson's disease. To realize the excitement which his description of this disease caused we must remember the state of

knowledge in 1911. At that time little or nothing was known of the function of the lenticular nucleus. Its connexion with abnormal movements had scarcely been suggested, and the term 'extrapyramidal' was unknown. The red nucleus and the cerebral cortex were the only recognized sources of motor paths to the limbs, the movements of athetosis and chorea being attributed to disturbances in the cortex and those of paralysis agitans to dysfunction of the red nucleus. Kinnier Wilson's demonstration that spasticity and tremor could be produced by a symmetrical lesion in the putamen and caudate nucleus was the first definite proof of a relationship between abnormal movements and the lenticular nucleus. His thesis was therefore much more than a description of a new disease entity. It opened the sluice gates to a spate of observation and speculation on the motor functions of the basal ganglia. In 1912 he read a short paper before the Neurological Society of Paris on this disease. His power of lucid presentation and his familiarity with French speech and thought gave added interest to his subject, and he received an ovation. The interest taken by German neurologists in his discovery was scarcely less, and the name "Wilson's disease" seems to have been first used in that country. He followed up his clinicopathological description by experimental work on the basal ganglia in monkeys in Sir Victor Horsley's laboratory with the aid of a scientific grant from the British Medical Association. His physiological and pathological work was however, interrupted by the war and thereafter his clinical work left him little time for the laboratory. The epidemic of encephalitis lethargica in 1918-20 increased interest in the extrapyramidal motor system and Wilson was appointed neurologist to the Metropolitan Asylums Board with special interest in the hospital for post-encephalitic cases which had been established in the London area. His wide knowledge of nervous and mental disease in childhood made his help very valuable, and when the Metropolitan Asylums Board lost its identity he continued as consulting neurologist to the London County Council.

In 1925 he gave the Croonian Lectures before the Royal College of Physicians of London, choosing as his subject "Disorders of Motility and Muscle Tone," and in 1930 he gave the Morison Lectures to the Royal College of Physicians of Edinburgh. Honours from foreign neurological societies fell thickly on him. He was made Officier de l'Instruction Publique du Republique Française, honorary Fellow of the Royal Medical Academy of Turin and honorary corresponding member of the Royal Academy of Medicine in Belgium, as well as honorary member of the American Neurological Association and of the Neurological Societies of Italy, Poland, Paris, Vienna, Philadelphia, Germany and Japan and of the Medical Society of Copenhagen. He was president of the Sections of Neurology and of Psychiatry of the Royal Society of Medicine and secretary (1911) and vice-president (1925) of the Section of Neurology and Psychiatry of the British Medical Association. He was secretary general of the International Neurological Congress in 1935 and the success of this congress and of the congress of 1931 at which he acted as secretary of the British section were largely attributable to his work and personality.

As a teacher and lecturer he had unique gifts. His unusual command of descriptive language, the clarity of exposition which often made the subject appear simpler than it actually was, his commanding presence and natural dramatic powers made his lectures a delight rather

than a task, and the halls where he lectured were often uncomfortably crowded. The same facility of expression is seen in his many writings. In addition to articles in medical papers he published books on *Aphasia* and on *Modern Problems in Neurology*, and for many years had been engaged in writing a textbook of neurology, but unfortunately did not live to finish it. In 1920 he started the *Journal of Neurology and Psychopathology* of which he continued as Editor when it was taken over by the British Medical Association. He married the daughter of the late Dr Alexander Bruce of Edinburgh, who founded and edited for many years the *Review of Neurology and Psychiatry*. She, with two sons and a daughter, survives him.

Dr R G GORDON writes

After the end of the war the *Review of Neurology and Psychiatry* did not resume publication, and in 1920 Kinnier Wilson and a few others decided that a second journal devoted to neurology would be beneficial, if not necessary, for the promotion of this branch of medicine in Great Britain. The stimulus of war experience had inspired a large number of neurologists in this country, and the study of nervous disease was going through a very active and rapidly developing phase. At the same time the almost new science of psychopathology was very much in the public eye, and, moreover, in serious danger of losing its moorings by becoming entirely divorced from the study of the anatomy, physiology, and pathology of the nervous system. In these circumstances a small committee was formed, representative of the various neurological and psychological interests concerned, to found a journal devoted to both branches of study. Kinnier Wilson was unanimously elected editor and continued in that office until his untimely death.

The *Journal of Neurology and Psychopathology* first appeared in May, 1920, being published by Messrs John Wright and Sons Ltd of Bristol. A few years later the publication was undertaken by Messrs Heinemann Ltd, and in July 1926 the British Medical Association undertook its publication as one of its special journals. This association has continued up to the present day and the Editorial Committee has nominally acted as a subcommittee of the Journal Committee.

One of the last acts of Wilson's life was to express his regret that he would no longer be enabled to continue the editorial work of the journal which lay so near his heart and to which he gave such unbounded labour and devotion. The *Journal of Neurology and Psychopathology* has come to take an honoured place in neurological literature and the credit of this achievement rests almost entirely with Wilson. He was a man who travelled widely and wherever he went attracted affection and admiration both for his personal qualities and for his enthusiasm for his subject and his interest in its many unsolved problems. This wide circle of friends and admirers enabled him to obtain articles of great value not only from British neurologists but also from those of America and the Continent of Europe and his editorial comments on current problems and the collection of abstracts and reviews which he established were very generally appreciated.

The *Journal of Neurology and Psychopathology* can never be the same without him whatever may be its future, and neurological literature must be the poorer for his loss.

[The photograph reproduced is by Elliott and Fry Ltd.]

SIR GEORGE BADGEROW, CMG, CVO,

MD Toronto F.R.C.S.Ed

Formerly Surgeon Golden Square Throat, Nose and Ear Hospital

The death took place suddenly in London on May 9 of Sir George Badgerow, consulting laryngologist and aurist of Harley Street. He was a Canadian, and although he had lived and practised in this country for a generation he never lost his Canadian affiliations, and was one of the best-known unofficial representatives of the Dominion in London. He was honorary secretary of the Canada

Club, and during the war he served as lieutenant colonel in the C.A.M.C., while thus serving he was mentioned in dispatches.

George Badgerow was born in Toronto in 1872, and received his education at Upper Canada College and Toronto University. He graduated in medicine in 1903, and six years later took the MD degree at Toronto. He then came to England and continued his studies at University College Hospital and Middlesex Hospital, and in 1910 became a Fellow of the Royal College of

Surgeons of Edinburgh. He had determined to devote himself to laryngology, and became attached to the Throat, Nose, and Ear Hospital, Golden Square, London, with which in one capacity or another, latterly as consulting surgeon, he was associated until the end of his life. Among the positions he held during the war were those of consulting surgeon to the Duchess of Connaught's Red Cross Hospital, Cliveden, Bucks; the Ontario Military Hospital, Orpington; the King's Canadian Hospital, Bushy Park; and the Officers' (Daughters of the Empire) Hospital. He was made a Commander of the Order of St Michael and St George in 1918, received a knighthood ten years later and was decorated CVO in 1930. He was an officer of the Order of the Hospital of St John of Jerusalem in London.

The number of appointments which Sir George Badgerow held in connexion with various institutions makes a long list. He was aural surgeon to the Royal Normal College and Academy of Music for the Blind at Upper Norwood, an institution in which he took a special interest, and the musical successes of the pupils gave him a professional as well as a personal pleasure. He was also consulting surgeon for diseases of the throat, nose and ear to the Reedham Orphanage, Purley; honorary laryngologist and aurist to the Warehouse Clerks and Drapers' Schools, Russell Hill, Surrey; and acted in a similar capacity to the Livingstone Hospital at Dartford. He did much good work as a member of the Education Committee of the King's Residential Open Air School for London Children, Bushy Park. But his work at Golden Square, where he began as senior resident surgeon for three years and served for a number of years as dean of the attached school, is his most memorable achievement.

His many appointments and a busy consulting practice left him little time even if he had the inclination to pursue literary and society activities. Papers from his pen made an occasional appearance in the medical periodicals, but he resisted the temptation, if he ever

experienced it to write a book. He was a member of the Section of Laryngology of the Royal Society of Medicine, and for a time on its council, but he did not often take part in sectional discussions. He was sometimes to be seen at clinical meetings of the Chelsea Clinical Society, and he was a member of the British Medical Association, which he joined immediately on coming to England in 1910, resigning shortly after the outbreak of war in 1914 and rejoining later. In 1933 he was elected a vice president of the Metropolitan Counties Branch.

Sir George Badgerow was a man of many parts, respected for the thoroughness with which he undertook anything he did—his work as a member of the Imperial War Graves Commission is specially remembered—and much esteemed in his profession while among those who knew him well, notably his fellow Canadians in London, he was regarded with much affection. He collapsed in a taxicab while on his way to Waterloo Station; the driver took him to St Thomas's Hospital, and on arrival there he was found to be dead.

[The photograph reproduced is by Elliott and Fry Ltd.]

J HAMBLEY ROWE, MA, MB CM., FSA

We regret to announce the sudden death of Dr Joseph Hambley Rowe on May 11 at his residence in Horton Grange Road, Bradford. Born at Hayle in Cornwall in 1870, and educated at Hayle Grammar School, he entered Aberdeen University in 1890, and in 1894 graduated M.B. CM. For three years he acted as an assistant in a general practice in Burnley, and then started to practise on his own in Cowling, Yorkshire. In 1900 he came to Bradford and was in general practice there till his death. During the war he held a temporary commission in the R.A.M.C., and subsequently became one of the chairmen of the Bradford Pensions Board. He was also surgeon in charge of the venereal diseases department at the Bradford Royal Infirmary, 1917-19, and for some years acted as honorary anaesthetist to the Bradford Children's Hospital and Waddilove's Samaritan Hospital. In 1919 he became a member of the British Medical Association.

In the period of his thirty-seven years in Bradford Dr Rowe was a member of many scientific societies among which may be mentioned Bradford Medical-Chirurgical Society (president, 1923), Bradford Scientific Association (president, 1906 and 1927), Bradford Historical and Antiquarian Society (president, 1910 and 1928), Royal Cornwall Polytechnic Society (president, 1930), Society of Antiquaries of London, Brontë Society (chairman of council and vice president). He was a Deputy Bard of the Cornish Gorsedd under the title of Tolzethan, and he was also an Honorary Welsh Bard.

Dr Rowe took a very deep interest in all things pertaining to his native county and he was a recognized authority on Cornish books. During his lifetime he collected a library of some 6,000 Cornish books and papers and this is regarded as one of the most comprehensive and representative collections of Cornish literature in the country. Pedigrees and parish registers also greatly interested him and he was the author of several books and pamphlets on these subjects. Another of his hobbies was the study of fossils and stone implements of which he had got together a fine collection. In 1924 when the Annual Meeting of the B.M.A. was held in Bradford Dr Rowe was entrusted with the compilation of the *Book of Bradford* and it has been authoritatively stated that his production was the best history of the city written so far. He was essentially a scholar

but instead of following the better-known highways of scientific scholarship he preferred to delve into the more or less untrodden byways of knowledge and learning and in 1931 the University of Leeds granted him the degree of M.A. for a thesis on Cornish lore.

Dr Rowe was a very lovable man, kindly and good-natured to all with whom he came in contact, and he had acquired a wide circle of friends in the city of his adoption. He had a keen sense of humour, and had collected a large number of medical stories in Yorkshire dialect, which he had intended to publish some day. He is survived by two sons and two daughters, his wife having predeceased him by only five weeks.

W N W-W

R T WILLIAMSON, M.D., F.R.C.P.

Consulting Physician Royal Infirmary, Manchester

Dr Richard Thomas Williamson, who died on April 28, was born at Burnley in 1862. He was a student of the Owens College, Manchester, and graduated in 1884 with the M.R.C.S. and L.S.A., as many able men did at that time, the Apothecaries' licence allowing them to dispense and charge for medicine if they wished. The M.B. B.S. of London University followed next year and the M.D. in 1887. He also studied for a time in Vienna, and this awakened an interest in the affairs of Middle Europe which he wrote about in later life. After six months' residence in the Manchester Infirmary as house physician he went to Birmingham, where he lectured on physiology in the medical school. His next hospital appointment was as clinical assistant at the Central London Ophthalmic Hospital, and this was followed by an appointment as house physician at the National Hospital, Queen Square. These London posts developed his leaning to neurology, and taught him the great value of examining the fundus of the eye in nervous and other diseases.

On returning to Manchester Williamson became medical registrar at the Royal Infirmary, and, in time, honorary physician at Ancoats Hospital, editor of the *Medical Chronicle* and in 1902 honorary assistant physician to the Royal Infirmary. He began in 1892 and continued for many years writing papers for *Brain* and other journals on subjects of neurological interest, and published small works on syphilitic and on vascular diseases of the spinal cord in the nineties. In this same decade he took a special interest in diabetes mellitus, and wrote a monograph on it in 1898. It was an impressive volume of 417 pages and in addition to relating his own experience of ten years he gave an exhaustive account of what was then known about the disease with references to the work of other observers. It gained him a reputation for treatment in those seemingly far away pre-insulin days and no little work in his consulting practice. For many years he was assistant lecturer in medicine to Professor Dreschfeld at the Manchester University taking neurology as his subject. In 1908 he published the material of fifteen years' teaching in a volume on *Diseases of the Spinal Cord*. Although it contained no fewer than 183 illustrations drawn by himself or from photomicrographs of his own sections he considered it merely as an introduction to the subject and a textbook for students. There was much original work in it and it established his distinct claim to be one of the leading neurologists of the day. A second impression was called for in 1911.

Williamson took a great deal of trouble in preparing diagrams and illustrations for his classes and his teaching was much appreciated by students. He was a man below the average height, and had in manner a good deal of

natural shy reserve. He became a Fellow of the Royal College of Physicians in 1900, and for a time acted as examiner in medicine for London University. During the war he served in the R.A.M.C. with charge of a neurological unit of the Second Western General Hospital in Manchester. At this time, however, he was suffering and for some months previously had suffered from ill-health which interfered with his writing, teaching, and general work. As his health did not improve he retired from practice, and left Manchester to live in the South of England in his fifty-fourth year. His retirement from the teaching staff was a great loss to the Manchester school. He then took an interest in general and medical history and wrote several articles, not for scholars, he said, but for students and practitioners without any previous acquaintance with the subject so written about. These he published in small paper-backed editions. The first was entitled *English Physicians of the Past* (1923), and contained very brief notes of about a dozen leading men of the eighteenth century. Next year appeared *Stories from English History Retold* consisting of essays on kings, monks, or other persons or episodes of interest before the Norman Conquest. In 1927 he published the *Log of an Old Physician* which contained some of his own experiences written in a semi-fictional style.

He married a Thuringian lady, and this led to travel and to his taking an interest in Continental history, especially that of Czechoslovakia. He wrote some thirty-four stories and sketches about this country, which were published in the New York journal *Slovak and Amerike*.

GEORGE SCOTT MACGREGOR, M.D.

Late Senior Surgeon and Superintendent Glasgow Hospital for Women.

On May 4 one of Glasgow's best-known medical men, Dr Scott MacGregor of Buckingham Terrace, passed away with tragic suddenness. He had had a severe illness in the early weeks of the year but had recovered sufficiently to be able to carry on his work without discomfort. On the morning of his death he had been attending patients as usual but a heart attack developed in the afternoon and he died before medical aid could be summoned.

A native of Tayport, Fife, George Scott MacGregor matriculated as a medical student at Edinburgh University in the year of the tercentenary celebrations. On completing his curriculum he continued his medical studies in Berlin, Vienna, and Paris before graduating M.B., Ch.M. at Edinburgh in 1888. After taking his degree he became first a medical and later a surgical resident in Edinburgh Royal Infirmary. His terms of office as such completed, he was appointed resident to Dr Halliday Croom of the gynaecological department at the Infirmary, and subsequently Dr Halliday Croom's assistant. In the middle nineties Dr Scott MacGregor took up general practice in Glasgow. During his early days there he acted as clinical tutor at Queen Margaret College, where he taught the first women medical students of Glasgow University and was an assistant surgeon at the Glasgow Hospital for Women. On the retirement from the latter of Dr Robert Bell, Dr Scott MacGregor, who was now devoting himself entirely to gynaecological work, was appointed senior surgeon and medical superintendent of the hospital positions which he held until three years ago. His long association with the hospital was not, however, then ended for he continued to act as honorary surgeon up to the time of his death.

It is in connexion with his work at the Women's Hospital that the late Dr Scott MacGregor will be best and

most widely remembered Established in 1887, the Glasgow Hospital for Diseases Peculiar to Women was one of the first public hospitals to receive patients on a contributory as distinguished from a charitable footing George Scott MacGregor threw himself into its work and welfare with his whole heart Trained in its methods, he had a warm side for the Edinburgh school and for those who came from it During the last months of the war and for some years afterwards his staff at the Women's Hospital with one exception consisted entirely of Edinburgh-trained men Mr J Hogarth Pringle, the consulting surgeon, Scott MacGregor himself and Dr E H. Lawrence Oliphant, the acting surgeons, and Drs Fraser Macdonald and Ross Scott, the acting physicians, had all been students in Edinburgh about the same time in the early 'eighties In a letter to Dr Scott MacGregor Sir John Halliday Croom, commenting on this fact, expressed his opinion that it was probably unique for so many ex-students of one professor to find themselves, over a quarter of a century later, associated together in this way

In his younger days Dr MacGregor was a keen athlete He never lost his taste for long walks, and only a few months ago expressed the opinion that he questioned if anyone else in Glasgow spent as little in tramway fares as he He is survived by his wife and a son, Dr Gordon MacGregor, who holds a professorial appointment in Singapore

ANDREW SMITH, M D

Dr Andrew Smith of Balgonie House, Ryton on Tyne, died on April 4 at the age of 57, and with his death a family medical sequence of sixty five years has been broken He had been ill for nearly a year, but kept in touch with his work until quite recently He was the son of the late Dr James Wilkie Smith who died in 1928 and who had one of the largest private and colliery practices in the North, covering the Ryton Crawcrook and High Spen districts It was said that during the war he had the medical care of 10,000 people Andrew Smith was educated at Newcastle Grammar School and at Edinburgh and took his medical course at the College of Medicine Newcastle graduating M B B S of the University of Durham in 1903 and taking his M D in 1910 He was house surgeon to Mr Rutherford Morison at the Royal Victoria Infirmary and began practice as a partner with his father He followed his father as medical officer of health to the Ryton Council in 1922 and issued a comprehensive booklet on the health of the district annually from that time He held the posts of police surgeon and vaccination officer and was in charge of the Castle Hill Convalescent Home Wylam attached to the Royal Infirmary, Newcastle-on Tyne He was a life president of the James Wilkie Smith Medical Institute Newcastle the institute having been given by his late father in memory of his son James Wilkie Smith who died in 1914 In this he took the greatest interest the fact that it fills a prominent place in the medical life of the district was very dear to him and the knowledge that he would be followed in this office by his cousin would have been most gratifying He joined the British Medical Association in 1905, and was a member of the Representative Body at five Annual Meetings Dr Smith was a keen rider with the Braes of Derwent Hunt up to 1914 One of his chief characteristics was his interest in clinical medicine and his presence at all the clinical meetings was always looked for He took post graduate courses up to the last year of his life, with the result that he was a very fine clinician From one of his pits came the

first case of Weil's disease, due to *Spirochaeta ictero-haemorrhagiae* diagnosed in this district by himself He could always be relied upon to have some interesting case on hand We shall all miss his cheerful presence, and his memory will long remain a pleasant one in this district. Our sympathy goes out to his widow and two daughters
J H

We regret to announce the death on May 7 at a nursing home in Dundee of Dr CHARLES KERR, consulting physician to the Dundee Royal Infirmary, medical examiner to the Shipping Federation, and formerly lecturer in clinical medicine at St. Andrews University Dr Kerr studied medicine at University College, Dundee, and the University of Edinburgh, graduating M B, C M Ed, with honours, in 1893 He then served at house surgeon and house physician at the Dundee Royal Infirmary, and was for a time resident medical assistant at Barnwood House Hospital for Mental Diseases before settling down to practise as a physician in Dundee During the war he was officer in charge of the medical division of a military general hospital in Egypt, with the acting rank of major R A M C, and received the O B E for his services Dr Kerr was for many years an active member of the Forfarshire Medical Association and had been a member of the British Medical Association since 1894 He contributed notes on clinical cases to the *Edinburgh Medical Journal* in 1910 and 1914 The funeral service was held on May 10 in the Cathedral Church of St. Paul, Dundee

Dr JAMES ADAMS who died on May 10, was born in South Devon eighty seven years ago, and studied medicine at St Bartholomew's Hospital and the University of Aberdeen taking the M R C S Eng and the M B A Aberd in 1873 the M D in 1875, and the F R C S in 1888 Before settling in practice at Eastbourne he had been house surgeon at the West London Hospital and assistant medical officer at Brook House Mental Hospital In the eighties and nineties he contributed papers on surgical subjects to the *Lancet* and the *Transactions of the Pathological Society* He was surgeon to the V A D hospital at Eastbourne during the war Dr Adams joined the British Medical Association as long ago as 1877, and had been president of the Eastbourne Chess Club

Dr ROBERT STORI BROWN died at Bootle in Cumberland on May 6 and by his death Bootle and district have lost a true friend The size of the funeral with a church full to capacity was indicative of the love and esteem in which he was held by his patients and all who knew him The following tribute from R T R gives some indication of the respect felt by his colleagues What struck me forcibly was his complete unselfishness his strong sense of duty and his kindness to everyone with whom he came in contact He never spared himself, and one is almost tempted to say he gave his life for others, for if ever a man worked hard and single handed in a scattered country practice R S Brown did It has sometimes been said that we country practitioners are inclined to get out of date and rusty in our work that could not be said of him for he kept himself abreast of the times in all branches of his professional work—and did it well What impressed me too was his punctilious adherence to the unwritten law of medical ethics and his promptness in correspondence over professional matters These together with a most lovable character endeared him to his brethren in the profession his patients and his many friends

We regret to announce the death in London on April 30 of Dr WILLIAM HENRY SARRA of Leigh on Sea Essex A student of the London Hospital he obtained the M R C S and L R C P diplomas in 1916, served at sea as temporary surgeon R N., and held the posts of house physician and clinical assistant in the surgical out patient department at the London Hospital After the war Dr Sarra joined the medical partnership in Southend

and district of which Dr J F Walker is the senior partner, and was appointed police surgeon for Leigh-on-Sea. He became a member of the British Medical Association in 1920 and last year was elected chairman of the South Essex Division.

Dr A CHARLES E GRAY who died at Cowden, Kent, on May 12, was a native of Edinburgh, where he studied medicine. He graduated M.B., C.M. in 1890, and proceeded M.D. in 1898, after holding the posts of resident physician at the Royal Infirmary and resident surgeon at the Royal Maternity Hospital. In his early days of practice in London he was appointed clinical assistant to the Paddington Green Children's Hospital. During the war he was officer in charge of the medical division of the Fulham Military Hospital and of cerebro spinal fever cases in the London area, holding the rank of Major R.A.M.C. He joined the British Medical Association in 1892.

A most promising professor of medicine in Strasbourg, GEORGES FONTES, has died after a short illness at the age of 43. When he first came from Montpellier to Strasbourg he taught biological chemistry. In 1927, when only 33 years old, he was appointed a professor without a chair. The death of Professor Paul Blum meant the appointment of Fontes to the chair of hydrology. He was a magnetic and inspiring teacher, and he had already conducted valuable research into the metabolism of water.

Medico-Legal

APPEAL BY DOCTOR'S WIDOW DISMISSED

Mrs Connolly widow of a patient, sued Dr Rubra, his doctor for failing to diagnose tuberculosis of the lungs, so that he suffered prolonged sickness and finally died. During the course of the action Dr Rubra died, and Mrs Connolly obtained leave to continue the action against his widow as his personal representative (the person who held his property in trust after death). Until recently an injured person could not maintain a personal action against the representatives of a dead person, for the right of action died with him. At the end of July, 1934, however, Parliament passed the Law Reform (Miscellaneous Provisions) Act, 1934, which changed the common law rule and provided that certain forms of personal action should be open to or available against the representatives of a deceased person. It is now possible therefore, for the widow of a deceased patient to claim damages from the estate of a deceased doctor.

An account of the hearing before Mr Justice Greaves-Lord appeared in this *Journal* on December 5 1936 (p. 1174). The learned judge found that the doctor had been negligent and awarded Mrs Connolly £5,000 damages against Dr Rubra's estate. Mrs Rubra appealed and her appeal was dismissed by the Court of Appeal on April 7. Lord Justice Greer, the president of the court, agreed with the learned judge's conclusion that the doctor had been negligent in his treatment of Mr Connolly, chiefly on the ground, which will hardly be questioned by any medical man, that if a doctor is in doubt whether tuberculosis is present or not he must make a further examination and satisfy himself that nothing more can be done for the patient. Dr Rubra had taken only one specimen of the sputum. Lord Justice Greer also found, on considering the whole of the evidence, that the doctor's negligence shortened the life of the patient, in that it was probable that if Mr Connolly had been treated with reasonable competence and skill his life would have been prolonged and probability is the standard of proof—at any rate in civil actions. As the judge had, in the opinion of the court, duly considered everything which he ought to have considered, his judgement was upheld.

The new state of the law undoubtedly introduces a possibility that surviving relatives of deceased doctors

may have to defend actions for negligence under the severe handicap of not being able to call the principal witness, the doctor himself, to defend his treatment. The present case, however, does not seem to be a good illustration of this handicap. So far as it is possible to judge from the available reports of the action, the negligence of the treatment was proved up to the hilt, and it is difficult to see what difference the presence of the doctor could have made. If he had survived, his estate would in all probability have been impoverished by the same amount as is now taken from it. It is a very grave misfortune for a widow to lose a large sum of capital through a fault that is not hers, but it is an even graver misfortune for a woman to lose a husband on whom she is dependent. The court will have constantly before its mind the peculiar difficulty of the defence, and will doubtless make allowances for it. To ascertain whether the new Act really operates harshly it will be necessary to examine a future case in which the element of doubt is much larger than in the present one. The most serious of all the consequences of the Act was at first that, whereas the doctor if alive would have been defended and indemnified by his protection society, his widow would not. The leading societies now extend their protection to doctors' widows.

The Services

The King has conferred the Efficiency Decoration of the Territorial Army upon Major Alfred Pam R.A.M.C.(T.A.) under the terms of the Royal Warrant dated September 23, 1930.

DEATHS IN THE SERVICES

Major General JOHN DALLAS EDGE, C.B. late R.A.M.C., died in Dublin on April 30 aged 89. He was born on March 9 1848, the son of Mr Joseph Edge of Timahoe, Queen's County, and was educated at the Meath Hospital, Dublin, taking the L.R.C.S.I. in 1870 and graduating M.D. of the Queen's, later the Royal, University of Ireland in the same year, subsequently he took the F.R.C.S.I. in 1889. Entering the Army as assistant surgeon on September 30 1871 he was specially promoted to surgeon on August 20 1873, became full colonel on June 1, 1901, and surgeon general on November 11 1903, retiring on March 9 1908. Soon after entering the Army he was sent to British Honduras and attached to the 1st West India Regiment. On September 1 1872 the fortified barracks at the small town of Orange Walk, where he was then serving, was surprised and rushed by a party of some 200 Yucatec Indians. The only other British officer present Lieutenant Smith was severely wounded and the defence fell on Edge who conducted it successfully, some fifty Indians were killed and almost half of the defending party were wounded. For this exploit Edge was specially promoted to surgeon. This was only the first of a long series of war services. He took part in the Zulu War of 1879 when he was present at the Battle of Gingulovo and the relief of Eishowe receiving the medal with a clasp. Immediately afterwards he was transferred to India where he served in the Second Afghan War taking part in the Battle of Maiwand and the defence of Kandahar and received the thanks of the Government of India as well as the Afghan medal with a clasp. In 1882 he accompanied the Indian contingent to Egypt, where he served at the Battle of Tel el-Kebir and the forced march to and occupation of Zagazig, receiving the Egyptian medal with a clasp, the Khedive's bronze star and the fourth class of the Osmanieh. He next served in the Burmese War of 1887 receiving the Frontier medal with two clasps. On the outbreak of the South African War he went with Buller's army to Natal but was soon after appointed P.M.O. of the Third Division under General Gatacre and was present in the action at Stormberg. Subsequently he served as P.M.O. of lines of communication and of Johannesburg district, took part in operations in the Orange Free State, Cape Colony, and the Transvaal, was mentioned in dispatches in the *London Gazette* of June 17 1902, and received the Queen's medal with three clasps and the King's medal with two clasps and the C.B. After the war he remained in South Africa as P.M.O. first of Cape Colony and then of the South African Command. In February 1905 he returned home and served as P.M.O. of the Irish Command until his retirement. In 1914 he received a good service

pension. He rejoined for service in the war of 1914-18 and from May 1915 to June 1917 was in charge of the Queen Alexandra Military Hospital at Millbank. In 1890 he married Jane daughter of Mr John Ruskell of Ballyrickard County Wicklow and had one son.

Major-General Sir PATRICK HEHIR KCIE CB, CMG Bengal Medical Service (ret.) died at Hove on May 1 aged 77. He was born at Templemore Tipperary on May 27 1859. Educated at Calcutta Medical School he entered the Bengal Submedical Department as a hospital apprentice in October, 1873, became assistant apothecary on January 31 1882, and resigned on February 8 1884. After his resignation he returned to Great Britain and entered Edinburgh University. He took the LRCSed and LSA in 1883 the MD at Brussels and the LRCPed the same year the FRCSed and the MRCS in 1885 the DPH Cantab in 1886 the DTM at Liverpool in 1904 the MRCPed in 1904 and the FRCPed in 1907. He entered the IMS as surgeon on April 1, 1886 passing second into Netley, became lieutenant-colonel after twenty years service colonel on March 25, 1912, surgeon general (the title being afterwards changed to major general) on March 13 1918 and retired on December 9 1919. He had a very distinguished career seeing much war service. Burma, 1886-7, medal with clasp. North West Frontier, Tirah 1897-8 medal with clasp. War of 1914-18 Iraq as ADMS of Colonel Townsends force in Kut advance on Kut, battle of Ctesiphon and defence of Kut taken prisoner at Kut but released by the Turks soon after mentioned in dispatches in the *London Gazette* of April 5, July 13 and October 19, 1916 and May 18 1918. Afghanistan and North West Frontier 1919. He received the CB on October 29, 1915, the CMG on February 15, 1917 the CIE on June 4, 1918, and the KCIE on January 1, 1920. After his retirement from the Service he acted as medical adviser to the British Red Cross Society's mission for the succour of Greek refugees. He was the author of many professional works: *Sanitation for Indian Schools* 1890. *Alcohol and its Effects* 1890. *Hygiene of Water Supplies* 1891. *Medical Jurisprudence for India* second edition 1891 with J B Gribble, 1CS (the first edition, by Gribble alone 1885). *Report of the First Hindurabad Chloroform Commission* 1892. *Hygiene and Sanitary Science* 1894. *Prevention of Disease in Indian Frontier Warfare* 1911. *The Medical Profession in India* 1923. *Ministry in India* 1927. In 1908 he married Dora granddaughter of Edward Lloyd, founder of the *Daily Chronicle* and had one daughter.

Lieut Colonel ROBERT LINDSAY LOVE, RAMC (ret.) died at Maidenhead on March 22 aged 84. He was born on February 19 1853 and was educated at the Queen's Colleges of Galway and of Belfast and at University College London graduating as BA in 1875 and as MD and MCh in 1877 at the Queen's later the Royal University of Ireland. Entering the Army as surgeon on July 31 1860 he became lieutenant-colonel after twenty years service and retired on February 19 1908. He served in the South African War of 1899-1902 taking part in operations in Natal and in the Transvaal including the defence of Ladysmith and the actions of Laings Nek Lombards Kop Belfast and Lydenberg was mentioned in dispatches in the *London Gazette* of February 9 1901 and received the Queen's medal with five clasps and the King's medal with two clasps.

Universities and Colleges

UNIVERSITY OF OXFORD

The Board of the Faculty of Medicine has co-opted Professor H W B Cairns FRCS Fellow of Balliol College for the statutory period.

The next Deans' dinner will take place in the Chantecler Restaurant Frith Street Soho W.C., on Thursday May 27 at 7 for 7.30 p.m. Those who wish to attend should inform the Dean at the Department of Medicine not later than Monday May 24.

The second B.M. Examination begins on Wednesday June 16. Names must be received by the Registrar before 10.30 a.m. on Tuesday June 1.

The examination for the Diploma in Ophthalmology begins on Monday June 21. Names must be received by the Registrar by Monday May 31.

The M.Ch. Examination begins on Thursday June 24. Names must be received by the Registrar not later than 3 p.m. on Saturday June 5.

UNIVERSITY OF CAMBRIDGE

At a congregation held on May 14 the following medical degrees were conferred:

MD—D G Macdonald J M Vazey C A Clarke
M.B. B.Chir.—*W Raffle *O L Lander C Adamson R S Castle
*M.B.—*D W C Gawne *P R Goodfellow D C G Ballingall
*C E Bevan O C Lloyd P E C Manson Bahr E C Herten
Greaven J R Kerr D F Lawson T W S Hills J R C Williams

* By proxy

UNIVERSITY OF SHEFFIELD

At its meeting on May 14 the University Council received a promise of an additional donation of £10,000 from Sir Robert Hadfield towards the University Buildings and Endowment Fund. The Council recorded its high appreciation of this offer which brings Sir Robert Hadfield's contributions to the University during the last three years to a total of £25,000 and the chairman was requested to convey to him the Council's deep sense of gratitude.

The Council accepted an offer from the Local Medical and Panel Committee of the West Riding of Yorkshire to award annually to final year students a prize of £25 in clinical medicine.

Dr M S Spink was appointed assistant bacteriologist and demonstrator.

The Council received with regret the resignations of Dr G Clark and Dr T E Gumpert of the posts of junior assistant bacteriologist and honorary demonstrator in physiology respectively.

ROYAL COLLEGE OF SURGEONS OF ENGLAND

A Council meeting was held on May 13, with the President Sir Cuthbert Wallace in the chair.

The Council congratulated the President on the appearance of his name in the Coronation Honours List as a baronet.

Mr Ernest Eric Young and Mr Arthur George Wells were admitted to the Fellowship.

Diplomas and Awards

Diplomas of Membership were granted jointly with the Royal College of Physicians to 208 candidates whose names were published in the report of the meeting of the Royal College of Physicians of London in the *Journal* of May 15 (p. 1049). In this list four names were misspelt: W D Benyon should be D W Beynon G W V Grieg should be G W V Greig J A Guest should be I A Guest and H E W Hardenbergh should be H E W Hardenberg.

Diplomas in Tropical Medicine and Hygiene were also granted jointly with the Royal College of Physicians to the thirty-one candidates whose names were published in the report of the meeting of the Royal College of Physicians of London in the *Journal* of May 15 (p. 1050).

The Honorary Gold Medal of the College was awarded to Sir James Frank Colyer KBE LL.D. FRCS L.D.S., in recognition of his many contributions to scientific odontology and to the service of the College.

The following hospitals were recognized for the six months surgical practice required of candidates for the Fellowship: Cumberland Infirmary (second house surgeon additional post) Bradford Royal Infirmary (resident surgical officer, first second and third house surgeon).

The President was appointed *ex officio* a member of the Governing Body of the British Post Graduate Medical School to hold office from July 10 1937 to July 9 1938.

ROYAL COLLEGE OF SURGEONS OF EDINBURGH

At a meeting of the Royal College of Surgeons of Edinburgh held on May 13 with the President Mr Henry Wade, in the chair the following candidates having passed the requisite examinations were admitted Fellows: Alice M Ross G S Adam J F Birrell A G Butters J A M Cameron L Chanock G B A Cowie Gladys H Dodds T B Field G C H Hogg B S Jones A C Kanaar, A A Klass W M Martin J D Mill W R D Mitchell J Montgomery, W A Morton F L Riskill R D Rowlands S K Sen R S Trueman D Wainwright W D Whyte J Wilton.

The Ivison Macadam Memorial Prize was awarded after a competitive examination in inorganic and organic chemistry to E. Stone. The Henry Arthur Dalziel Ferns Bursary was awarded after a competitive examination in organic chemistry in its application to medicine to H Fernbach. The Bathgate Memorial Prize was awarded after a competitive examination in materia medica and therapeutics to E. W Langs.

Medical News

Professor Edward Mapother will deliver his presidential address before the Listerian Society of King's College Hospital at the hospital on Wednesday, May 26 at 8.15 p.m. His subject is 'The Psychiatry that is Coming'.

Professor J. G. Fitzgerald, M.D., Director of the School of Hygiene at the University of Toronto is now on a year's leave of absence to study the teaching of preventive medicine in medical schools in the United States, Canada, the British Isles and other countries of Europe for the Rockefeller Foundation. Professor Fitzgerald has accepted the Chadwick Trustees' invitation to give a Chadwick Public Lecture at 26, Portland Place W. on Wednesday, May 26, at 5.30 p.m. His subject is 'Preventive Medicine—an Avenue of Good Will'.

A lecture on 'The Biochemistry of Milk Secretion' will be delivered by Professor H. D. Kay, D.Sc., director of the National Institute for Research in Dairying at the Royal Society of Arts, John Street, Adelphi W.C., on Wednesday, May 26 at 8.15 p.m. Applications for tickets should be made to the secretary of the society.

We are informed that the next meeting of the Chelsea Clinical Society will be held at the Hotel Rembrandt, Thurloe Place S.W. on Tuesday, May 25 at 8.30 p.m., and not on May 18 as previously announced. A discussion on 'Short wave Therapy' will be opened by Dr. Philippe Bauwens and Dr. F. Howard Humphris.

A meeting of the Royal Sanitary Institute to be held in conjunction with the Northern Branch of the Society of Medical Officers of Health at the Connaught Hall, Y.M.C.A. Buildings, Blackett Street, Newcastle upon Tyne, on Friday, May 28 at 5 p.m., will be given up to a discussion on 'The Difficulties of Nutritional Assessment', to be opened by Dr. H. E. Magee, Dr. G. C. M. Mongie, and Dr. J. C. Spence.

The annual general meeting of the British Institute of Radiology will be held at 32 Welbeck Street W. on Thursday, May 27 at 6.30 p.m., and not on May 20 as previously arranged.

A special meeting of Fellows of the Royal Society of Medicine will be held at 1 Wimpole Street W. on Tuesday, May 25 at 5 p.m., for the nomination of officers and council for 1937-8.

A meeting of the Association of Industrial Medical Officers will be held at Swansea on Friday, May 28 when members of the Association will be the guests of the Mond Nickel Co. Ltd. The following programme has been arranged: 9.30 a.m. business meeting at Metropole Hotel Swansea; 10.30 a.m. visit to Nickel Refinery, Clydach; 12 noon visit to Clydach Hospital with demonstration of x-rays etc. by Dr. A. J. Amor; 1 p.m. lunch at the Mond Recreation Club as guests of Mr. A. Parker Hague; 2.30 p.m. visit to Trefri Colliery; 7.30 for 8 p.m. members will be the guests of the Mond Nickel Company at dinner at the Metropole Hotel Swansea.

The annual missionary breakfast of the Medical Prayer Union will be held in the Refectory of University College Gower Street W.C. on Wednesday, May 26 at 8 a.m. when the speaker will be Dr. Clement C. Chesterman. Those wishing to attend should notify Dr. Tom J. Jays, Livingstone College, Leyton E.10.

The first congress of the Journées Internationales de Pathologie et d'Organisation du Travail will be held in Paris from June 1 to 6 under the presidency of Professor V. Balthazard. The fee is 100 francs (French) entitling the subscriber to take part in the various meetings and excursions and to receive the publications of the reports of lectures. The secretary is Dr. G. Hrusser, Institute Médico-Legal, Place Mazas, Paris XVIe.

The third congress of Austrian laryngologists will be held at Innsbruck on May 28 and 29 under the presidency of Professor Urbantschitsch, when the chief subjects for discussion will be progress in the functional examination of the ear and its diagnostic and therapeutic results and the relation of the upper respiratory tract with the general constitution.

The Royal Institute of Public Health and Institute of Hygiene are holding a congress in Margate from May 25 to 29 under the presidency of Lord Horder. The five sections and their presidents are: State Medicine and Industrial Hygiene (Captain G. S. Elliston, M.P.), Women and Children and the Public Health (The Marchioness of Reading), Tuberculosis (Dr. R. A. Young), Rheumatism and Allied Diseases (Sir Robert Stanton Woods), Nutrition and Physical Training (Sir Stanley Woodward). The social functions include two receptions and dances, a tour of Canterbury Cathedral, visits to medical institutions, a dinner, and a day excursion through Kent.

On the occasion of the fiftieth anniversary of the Bassini operation, the University of Padua publishes two volumes of 'Writings on the Surgery of Hernia' containing a reprint of the original papers of Bassini as well as contributions to the problems of hernia by surgeons of the whole world. The Italian Surgical Society has called for June 6 in Padua an extraordinary meeting of the society in the course of which, after two reports on the 'Surgery of Inguinal Hernia' (by S. Spangaro) and on the 'Surgery of Crural Hernia' (by A. Austoni), the various problems of hernial surgery will come under discussion. The meeting will last only one day. The ceremony will take place at 10 a.m. in the Aula Magna of the University before the scientific meeting. Special facilities are granted by the Italian railways during the Padua Sample Fair. British surgeons wishing to attend the meeting are requested to give in their adhesions to the Clinica Chirurgica della R. Università di Padova, which puts itself at their disposal for detailed information.

Miss Sophia Gifford Edmonds of London has given the sum of £500 a year to enable poor persons living outside a radius of fifty miles from the town to obtain treatment at Droitwich Spa. The fund will be known as the Droitwich Brine Fund for the Treatment of Rheumatism.

As only a limited number of patients can be accepted under the scheme, participation in it is being offered to certain general hospitals in England and Wales. The founder hopes however that in time other charitably disposed persons will be led to enlarge its scope.

Mr. J. W. Thomson, general surgeon, and Mr. Lionel Wells, ophthalmic and aural surgeon, have resigned from the honorary surgical staff of Clayton Hospital, Wakefield, after thirty years' service, and the hospital board has elected them honorary consulting surgeons.

In view of the growing public interest in the activities of the National Institute of Industrial Psychology shown in recent years, the council has been considering what steps should be taken to cope with its increasing work. As a result, Mr. T. G. Rose, M.I.Mech.E., has been appointed general director of the Institute to collaborate with Dr. C. S. Myers, F.R.S., the principal who will retain the position held by him since its inception sixteen years ago.

Professor W. Löffler, director of the polyclinic at Zurich, has been nominated successor of Professor O. Naegeli in the chair of clinical medicine at Zurich.

Runwell Hospital near Wickford, Essex, a large modern institution for the treatment of nervous and mental disorders, will be opened by the Minister of Health on June 14.

The sixty-sixth annual inter-hospitals sports will be held at the Duke of York's Headquarters, Chelsea, S.W., on Wednesday, May 26 at 2.30 p.m.

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR BRITISH MEDICAL JOURNAL B.M.A. HOUSE, TAVISTOCK SQUARE, W.C.1

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication.

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager, British Medical Association House, Tavistock Square, W.C.1 on receipt of proofs. Authors over seas should indicate on MSS if reprints are required as proofs are not sent abroad.

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager.

QUERIES AND ANSWERS

Chronic Glossitis

"APPLEBY" would gratefully receive hints on treatment for an obstinate chronic glossitis (following general debility consequent upon septicaemia) which resists all the familiar forms of medication.

Gas Dispersion in Pyelography

"BORBORGYNIUS" writes: Is there any satisfactory method of obtaining a clear field unobstructed by intestinal gas in cases in which intravenous pyelography has to be done? If so how long beforehand must the patient be prepared for X rays?

Treatment of Keloid

F.R.C.S. (Chikmagalur) writes: A patient aged 46 with a small papilloma in her breast and a history of bleeding from the nipple had her breast excised nine months ago and has developed a keloid eight inches by half an inch all along the scar of the operation wound (Stewart's incision) round which she has been feeling pins and needles. Would radium help to relieve her condition? If so would any of your readers give details of its application mentioning the dosage etc. If not, what other measures for her relief might be suggested?

Income Tax

Cash or Earnings Basis

"D.L." inquires whether it is correct that inspectors of taxes accept the cash basis in the case of medical practitioners, he has made only one year's return and already finds the earnings basis "confusing and incorrect."

** It is of course a truism to say that the assessable profit is the excess of the gross income over the expenses of the practice. The gross income for income tax purposes is strictly the amount of the bookings for the year less a carefully estimated deduction for loss by bad and doubtful debts. When a practice has been running for some years and is neither expanding nor contracting the gross income so calculated for a year will normally be the same as the amount of the cash receipts in that year. In such circumstances the revenue authorities will often accept returns on the cash receipt basis. In the first two or three years of a practice the cash receipts do not provide a true indication of the amount of the gross earnings and this indication applies at present to our correspondent. The apparently applies at present to our correspondent. The earnings basis may be "confusing" but should not be unfair if a proper deduction is made for probable loss by bad debts.

Income from Abroad—Remittances

"M.R.C.S." to whom a reply was given in our issue of March 27—inquires further as to the scope of liability on remittances.

** There is an old law case authority for the view that any amounts remitted to this country would be liable as income even though ostensibly capital if there was foreign income sufficient to cover the amount. But that has been modified by more recent decisions which have however left the position rather complex. Taking the specific points raised by "M.R.C.S." (a) sums representing savings and transferred to England prior to arrival here would in our opinion not be liable to tax unless the remittance was made in the same financial year (ending on April 5) as the visit to this country and (b) a sum paid by cheque on a bank outside the United Kingdom would be liable as a remittance of income if paid for current living expenses, but not if paid for capital goods—for example furniture of a house.

LETTERS, NOTES, ETC

Short-wave Therapy

Dr C. H. DALTON D.M.R.E. (Ipswich) writes with reference to Dr H. J. Taylor's letter (*Journal* May 8 p. 1008). Research work has been carried out on the Continent for over ten years by Dr E. Schliephake and others and these observers produced considerable evidence that the ultra-short wave lengths (for example 6 metres) act quite differently in acute infections from the longer wave lengths (for example 30 metres). A representative of one American firm that markets a short wave machine in this country informed me that this operates on a fixed wave length of 25 metres and if other work in America has been conducted on this wave length the results may well suggest that a specific action has not been obtained. I have been working with ultra short waves (6 metres) for over two years and I am convinced that there is a specific action obtained from the nature of the radiation itself. A matter of this description cannot be entered into adequately in the course of a brief letter but under this treatment I have seen a number of acute infections such as acute streptococcal lymphangitis in nurses and members of the resident medical staff at the East Suffolk Hospital subside in forty-eight hours. Regarding chronic rheumatic infections I agree that heat is the main consideration. In a superficial joint that is easy to approach—for example a knee joint—I doubt if there is any considerable improvement on the results obtained by long wave diathermy but in the case of deep structures—for example a hip-joint—there is no doubt that the results of short wave treatment are considerably better.

Explanation and Apology

RICHARD COSTAIN LTD. (London W.C.1) write: In the booklet recently issued by our firm in connexion with a block of flats in Dolphin Square the name of Mr Hope Carlton, F.R.C.S. was mentioned as being a doctor in residence there and available in emergency. We regret to say that Mr Hope Carlton's name was inserted in this booklet without any authority from him without his authority being sought and without his knowledge and we desire to express to him our sincere apology for the unauthorized use of his name and any inconvenience that he may have been caused thereby. Mr Hope Carlton is not practising at or from Dolphin Square which is his private residence but he is continuing to carry on his practice as a consulting surgeon as before.

Corrigenda

In the paper on "Endometrial Biopsy" by Drs Sharman and Sheehan on page 965 of the *Journal* of May 8 a printer's error occurs involving the omission of a line. The paragraph under the heading "The New Technique" should begin "To overcome these various imperfections in the technique the present instrument has been devised and has proved eminently satisfactory after extensive trials."

In the bibliography to the article on hereditary sebaceous cysts by J. T. Ingram and M. C. Oldfield (*Journal* May 8 p. 960) a reference printed as Bosellini P. L. (1898) *Arch. Derm. Syph. Chicago* 45 81 should have read Bosellini P. L. (1898) *Arch. Derm. Syph. Wien* 45 81.

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

397 Dangers of Salt-free Diet

J. CLAUSEN (*Ugeskr. Laeg* March 18, 1937 p 301) considers that a salt free diet is most beneficial in chronic nephritis accompanied by oedema but when there is no oedema or when it has been banished by appropriate treatment a salt free diet may in certain cases be directly injurious. In support of this opinion he records the case of a woman, aged 28, with a history of nephritis since the age of 15. On admission to hospital she suffered from drowsiness lassitude and oedema. The urine contained albumin leucocytes, and casts but was sterile. Its specific gravity was 1009, and the blood urea was 297 mg per 100 ccm. She was put on a salt-free diet and after about ten days her oedema vanished. The salt free diet was continued, however, with the result that the sodium chloride content of the serum fell from 360 to 294 mg per 100 ccm at the same time that the urea content of the blood rose to 402 mg per 100 ccm. There were signs of progressive uraemia and loss of weight due to dehydration. Accordingly on four successive days she was given an intravenous injection of 100 ccm of a 10 per cent solution of sodium chloride. The sodium chloride content of the serum rose in four days to the normal figure of 350 mg per 100 ccm. At the same time the weight rose owing to retention of fluid, and the uraemia abated.

398 Gastric Secretion

By means of a double gastro-duodenal tube with continuous separate removal of gastric and duodenal contents and of saliva G. WELIN and A. R. FRISK (*Acta med scand* 1936 90, p 542) have studied quantitatively the gastric secretion in empty human stomachs after intravenous insulin injection in normal individuals, and in cases of hyperacidity hypo acidity and achylia. They consider that a secretion of 100 to 200 ccm of gastric juice in sixty minutes after insulin injection may be accepted as normal, over 200 ccm represents hypersecretion and less than 100 ccm hyposecretion. Achylia exists when there is no augmented secretion. The total chlorine content of the gastric juice becomes equimolecular with the total fixed base of the plasma and the total acidity may closely approach the total chlorine content. Total chlorides and acidity are frequently lower than maximal, and are then positively correlated. There is no correlation between the rate of secretion and total chlorides or total acidity. There is a negative correlation between the amount of mucus and the total acidity and total chlorides. Submaximal concentrations of acidity and chlorides are thus explained by the diluting effect of mucus which has a low chloride concentration and is alkaline. Hypo acidity therefore results from the diluting effect of mucus on a hyposecretion—that is a reduced rate of secretion of a normal juice. In hyperacidity the pathological disturbance is hypersecretion of a juice of normal composition and there is often an absence of mucus.

399 Parathyroid Insufficiency and Epilepsy

According to K. HOESCH (*Munch med Wschr* March 19 1937 p 467) chronic parathyroid insufficiency is now more commonly detected and is a fairly frequent cause of epileptic phenomena. It may take a chronic course for many years until suddenly there occurs, often after violent exertion infections or pregnancy—a severe attack of tetany or tetany with epilepsy. Not seldom its course is monosymptomatic the chief features being one of the following: headaches impetigo or eczema syncopal attacks epilepsy tetany or migraine. The diagnosis is confirmed (1) by detection by the slit lamp of the charac-

teristic opacities in the lens (sight may be little or not at all affected) (2) by the electrical hyperexcitability of the median and ulnar nerves (3) by estimation of the blood calcium which by Holtz's method shows a decrease that may be slight, and (4) possibly by the detection of characteristic QT changes in the electrocardiogram. Hoesch gives a preliminary account of thirty cases in which he is satisfied that epilepsy was due to chronic parathyroid deficiency. In treatment calcium and/or parathyroid therapy gives transitory improvement but Hoesch greatly prefers AT 10 (0.5 per cent oily solution of dihydrotachysterin), given orally in doses diminishing from 20 to 30 ccm to 6 to 10 ccm in the course of a week. Careful control by blood-calcium estimations is essential. This treatment may have to be continued indefinitely it is important that the blood calcium should not exceed 12 mg per 100 ccm.

Surgery

400 Echinococcus Disease of Bone

E. ETTORRE (*Arch Ital Chir* January 1937 p 149), who records a personal case of echinococcus disease of the scapula, states that localization of the disease in bone is rare as Ivanissevitch among 1734 cases of echinococcus disease notified in the Argentine Republic found only twenty-nine cases (1.6 per cent) in which a bone was involved. Ettorre could collect only eight cases besides his own in which the scapula was affected. His patient was a woman aged 28 a native of Milan, who at the age of 12 had received a violent blow on her left shoulder. About three years later she began to feel pain in the shoulder, which was attributed to pleurisy and treated as such. During the last three years pain was felt in movements of the shoulder, especially on abduction and internal rotation and a diagnosis of arthritis was made. Shortly afterwards a swelling appeared gradually increasing in size. As the result of radiological examination and exploratory puncture a diagnosis of echinococcus disease of the scapula was made and the cysts successfully removed. Complete recovery took place.

401 Hyperthyroidism

F. LAHEY (*Surg Gynec Obstet* February 15 1937, No 2a, p 304) presents views on the management of severe hyperthyroidism based on 15200 thyroid operations carried out during a period of fifteen years upon 13000 patients. The mortality rate counting all patients who died from any cause while in the hospital was 0.85 per cent in the series. Of this number 40 per cent died of thyroid crises 10 per cent of cardiac failure, and 10 per cent of emboli. The remainder died of carcinoma or other causes. During this time there were fifty three non-operative deaths in patients with such advanced degrees of hyperthyroidism that no operation could be contemplated. It is suggested that this mortality is largely due to delay in bringing the patient for operative treatment. Operation may not be advised until a thyroid crisis or some severe cardiac lesion has developed. Even if patients are first seen when in a state of acute hyperthyroidism the application of proper principles will cause such an improvement as to remove temporarily the danger of immediate death and ensure that subtotal thyroidectomy can be carried out with a risk rate of only 3.5 per cent. It has been shown that before operation 70 per cent of cases have an abnormally high blood iodine which drops to normal after subtotal thyroidectomy. As the active principle of the thyroid gland thyroxine is over 60 per cent iodine it is suggested that hyperthyroidism is due to an excessive introduction of thyroxine into the blood. The author also considers it probable that during

an acute thyroid crisis with delirium vomiting diarrhoea and a rise of temperature, these reactions are the result of effects on the liver, and may be combated by intravenous injection of glucose and fluids in addition to the control of hyperthyroidism by iodine rest, and sedatives. Subtotal thyroidectomy is advised for all patients who show no obvious improvement after four weeks of non-operative treatment. Any patient with mild cardiac failure or cardiac arrhythmia should be operated on immediately, and also those whose condition is complicated by diabetes or pregnancy. Patients who have recovered from a thyroid crisis can be operated on, after taking a high carbohydrate diet for three weeks, by the two stage method without undue risk. In some cases a preliminary ligation is of value, and in certain cases multiple stage operations will lower the operative risk.

402 Headache in Head Injuries

H J SVORODA (*Zbl Chir* March 13, 1937, p 624) discusses the biological action of hypotonic and hypertonic solutions, and proceeds to record his successes with hypertonic solutions of glucose in increased intracranial pressure following injuries to the skull. He suggests that urotropine should be administered prophylactically and three injections of 50 ccm of a 30 per cent solution of glucose should be given after the appearance of the headache.

403 Heredity in Peptic Ulcer

L UGELLI (*Polichinico Sez Prat*, March 22, 1937, p 558) reviews the literature showing the frequency of hereditary and familial predisposition in gastric and duodenal ulcer, and records his observations on 334 cases of peptic ulcer admitted to the Flajant pavilion of the Littorio Hospital, Rome, from 1932 to 1935. Of these, nineteen patients (5.68 per cent) gave a history of direct heredity and five gave one of collaterals affected with ulcer, so that in twenty four (7.18 per cent) there was a history of familial peptic ulcer. The most remarkable example in Ugelli's series was that of two brothers, aged 28 and 33, whose father was a gastric patient; they both underwent gastroenterostomy for duodenal ulcer and subsequently were operated on again for a recurrence of an ulcer at the site of anastomosis. Ugelli comes to the conclusion that a hereditary and constitutional factor plays some part in the causation of peptic ulcer.

404 Conservative Gall-bladder Surgery

F MANDL (*Wien klin Wschr* March 19, 1937, p 371) relates his experiences with the operation of mucoclasia. This consists in the incision of the gall bladder removal of the stones, and cauterization of the mucous membrane of the gall-bladder down to the serosa. Either the thermocautery or the diathermy current may be used for this purpose although the author prefers the thermocautery. Of the thirty two patients treated in this way twenty two were cured completely, six remained uninfluenced and four died. In two cases of carcinoma of the gall bladder pain was relieved following the cauterization of the mucous membrane.

405 Common Bile Duct Obstruction

E TANTINI (*Riv Chir* February 1937, p 73) who records an illustrative case, remarks that though the occurrence of jaundice due to obstruction of the common bile duct by new growths is a frequent occurrence the localization of a tuberculous process in the lymphatic glands at the hepatic hilum as a cause of jaundice is not so well known. Tantini's case was that of a woman aged 40 who in October, 1927, was suddenly seized with severe pain in the right hypochondrium followed by jaundice the next day. The symptoms subsided in a fortnight but similar attacks took place in March 1928 and December, 1929, when a tender swelling was found in the right upper

abdominal quadrant. A diagnosis of cholelithiasis was made. On laparotomy no calculi were seen, but only large lymphatic glands at the hilum of the liver, which were removed and proved to be tuberculous. The patient made a complete recovery.

Therapeutics

406

Paraffin for Local Heat

F KRUSEN (*Proc Mayo Clin*, February 3, 1937, p 73) describes a method of using a simple paraffin bath in districts where electricity is not available for the application of local heat. The use of hot towels, hot salt bags, or hot fomentations is often unsatisfactory, and a simple method of applying heat is described. About eight pounds of paraffin are placed in the inner pan of a 1½-gallon double boiler, the outer pan being filled with water and heated on a stove until the paraffin has reached melting-point. It is then allowed to cool to 75°C. A clean paint brush is then immersed in the melted paraffin and the part to be treated is painted with about a dozen coats of liquid paraffin. This hardens and retains its heat for about twenty minutes, when it can be lifted off in a single sheet and returned to the boiler for subsequent use. Massage may be applied immediately after removal of the paraffin. Applications of warm paraffin are particularly indicated in the treatment of arthritis, fibrositis, sprains, stiffness of joints and muscles, or in the treatment of fractures after bony union has been established.

407

Hay Fever

E URBACH (*Munch med Wschr* March 26, 1937, p 488) has devised a new method of treating hay fever. The patient's reaction to any particular pollen is tested by applying the different pollens to the mucous membrane of the nose. The rare hay conjunctivitis is tested in a similar way by applying a suspension of pollen to the conjunctiva. The treatment consists in the oral administration of the different pollens according to the specific sensitiveness of the patient. The author uses three kinds of pollen preparations. These are known under the names of 'polysemin,' 'polyfrumin,' and 'polyflorin.' Successful results are reported in 74 per cent of patients suffering from hay fever, and a considerable improvement was achieved in another 22 per cent of cases. The treatment appears to be not only palliative; patients who have been treated for two successive years lose the pre-disposition to hay fever.

Neurology

408

Chronic Subdural Haematoma

G HORRAX *et al* (*New Engl J Med* March 4, 1937, p 381) point out that chronic subdural haematomas occur more often than is generally realized. They have treated eighteen cases in two years. Most cases are misdiagnosed as cerebral arteriosclerosis, old encephalitis or post-traumatic headache, and may only be recognized after small bilateral burr openings have been made in the skull, visualization is then possible. This step should be taken in (1) patients whose histories strongly suggest the presence of a haematoma, (2) those with indefinite mental symptoms who relapse into deep drowsiness and coma and are often diagnosed as post-encephalitics, (3) those that are thought to have a brain tumour. In the third group a complete investigation is usually made but patients in the first and second groups are usually left to die or are sent to mental institutions when actually their condition is curable. For purposes of exploration two small trephine openings are made in the parieto-occipital region 4 cm lateral to the median line. If a white or pinkish white dura is seen there is usually no

clot present, but for certainty needles should be inserted into the ventricles for 4½ to 5 cm emptying them and filling them with air so that subsequent x rays will show compression or distortion of one or both ventricles if haematomas are present. If a clot is present the encapsulating membrane is incised the liquefied contents sucked out with a catheter attached to a syringe, and the cavity gently washed out with normal saline. In their eighteen cases the authors had a post operative mortality of nil and a case mortality of 5.5 per cent. Bilateral haematomas were found in 27.7 per cent. The authors strongly advocate their simple method of tapping rather than the more dangerous bone flap operation. Only when the haematomas are well organized as in four of their eighteen cases, is this flap operation necessary. The prognosis is excellent. Fifteen of their patients recovered entirely and went back to their usual occupations two required further institutional treatment and one died six months later from a cause unrelated to the subdural haematoma.

409 Blood Sedimentation Tests in Brain Disease

E. SINGER and E. EDEL (*Wien klin Wschr* March 26, 1937, p. 406) have examined the blood sedimentation rate in 115 cases of brain disease in ninety of which an exact diagnosis was made. A sedimentation rate of 3 to 10 mm an hour was taken as normal. Normal rates were found in three cases of hydrocephalus, in four of serous meningitis, in four of neurofibromata, in one of haemangioma, in three old cases of cerebral trauma and in some cases of cerebral arteriosclerosis. A moderate increase in the sedimentation rate was found in seven cases of tumour of the pituitary in six cases of meningioma and in one case of eysticercosis. A great increase in rate was found in two cases of pachymeningitis in one case of metastases from a hypernephroma, in one case of actinomycosis and in one of acute multiple sclerosis. The authors point out that the value of the sedimentation test to the neurological surgeon lies in the possibility of making a differential diagnosis between cerebral tumour and other conditions with a similar symptom-complex. The sedimentation rate is moderately increased in cerebral tumour. In hydrocephalus and serous meningitis it is normal. In acute encephalitis it is very greatly increased. In haemorrhagic pachymeningitis it is greatly increased. In differentiating between arteriosclerosis and tumour a great increase in rate points to the former when it is normal or moderately increased no diagnosis can be arrived at on account of the variability of the rate in arteriosclerosis. The test is of no value in differentiating between meningioma and glioma as in both the rate is increased. Metastatic cancers have a greatly increased rate and can thus be differentiated from benign tumours.

410 Labyrinthine Disturbances in Cerebellar Tumours

M. AUBRY and J. LEREBOLLET (*Ann Oto laryng* January 1937, p. 1) record their observations on twenty-one cases of cerebellar tumours and four cases of cerebellar abscesses. In one group (eight patients) the tumours were purely cerebellar, situated at some distance from the vestibular centres and there were no labyrinthine disturbances. In a second group tumours situated more anteriorly involved the vestibular centres, in this group of cases the tumours were either in contact with the vestibular centres (twelve) or had actually destroyed the centres from which the vestibular roots of the eighth nerve arises (five). The clinical signs on which the authors lay special stress are hearing tests which usually show a normal cochlear function, spontaneous nystagmus absent in the first group but nearly always present in the second group and spontaneous deviation of the index finger usually present when the vestibular centres are involved. Caloric tests may indicate a hyperexcitable vestibular function or *syndrome d'irritation* sometimes seen in the first group or the tests show that

the centre has ceased to function *syndrome de deficit*. An analysis was also made of the histological nature of the tumours (papilloma, haemangioma, tubercle, abscess, etc.) in relation to the vestibular reactions. The results of this investigation were mainly negative. The vestibular signs which often accompany tumours and abscesses of the cerebellum and of the fourth ventricle do not depend on the histological nature of the tumours. Further they do not depend on the increased intracranial pressure which may have resulted. The vestibular reactions depend solely on the situation of the tumour in relation to the vestibular centres in the floor of the fourth ventricle. The cerebellar tumours which lie well away from the fourth ventricle in the posterior part of the cerebellum are the more favourable ones.

411 Epileptic Symptoms of Brain Tumour

A. REUTER (*Möschers Krebsbekämpfung* March, 1937, p. 73) draws attention to the importance of excluding cerebral tumour in epilepsy. He quotes a case in which tumour could only be diagnosed after twelve years fits, and adds two records of the diagnosis of a tumour four weeks and seven years respectively after the first convulsion. In the former case suspicions were aroused first by the report of an unpleasant taste and smell preceding the attacks (this may occur, however in non organic epilepsy) and secondly by a unilateral distribution of the clonic phenomena. Other signs pointing to an organic cause (not necessarily tumour however) are (1) increase of proteins in the cerebro spinal fluid, (2) residual signs of organic nervous disease—for example hemiparesis—following an epileptic convulsion. Four weeks after the first attack in Reuter's case (a man aged 20) an encephalogram showed ventricular displacement to the right and an arteriogram showed vascular displacements near the fissure of Sylvius and the fronto parietal region. A large meningioma was successfully removed from the left temporal cortex.

412 Experimental Epilepsy

S. K. KAPRAN and A. F. SLINKO (*J. méd. Ukraine* 1936, 6, 1, p. 45) have investigated the appearance of epileptic attacks after the freezing of a portion of the cerebral cortex, and the effect of morphine, ether, and chloroform on the severity of these attacks. They have further investigated the influence of sectioning all the meningeal layers over the frozen portions of the cerebral cortex on the development of the attacks. Their experiments on animals proved that freezing of part of the cerebral cortex through the intact dura has different results according to the nature of the general anaesthetic. The attacks were always of a more severe nature when either morphine or ether were used. The attacks were milder when the dura overlying the frozen part was sectioned after the freezing. The authors therefore conclude that the epileptic attacks following freezing portions of the cortex are caused by an increase of the intracranial pressure and by an intoxication of the brain. Theoretical considerations lead them to deprecate the use of morphine and ether in intracranial operations. Chloroform appears to be less toxic in such cases.

413

Schizophrenia

M. STECK (*Rev. med. Suisse rom.* March 10 1937, p. 129) states that at Cery cures or very great improvements are now attained in some 43 per cent of cases of schizophrenia. Schizophrenia has no extensive cerebral lesions and in a first attack the prognosis is in general good. The most important feature in treatment is the adoption of re-educational methods with occupational therapy from such "corrective psychotherapy" all psycho-analytical treatment should be rigidly excluded. At Cery the proportion of occupied has risen since 1904 from 44 to 86 per cent for men and from 53 to 85 per cent for women as a consequence katatonia is very rarely

seen. The assessment of the true value of new treatments is difficult in a disease in which spontaneous remissions are frequent, but in Steck's judgement there is satisfactory evidence of a good effect in many cases from (1) intraspinal injections producing aseptic meningitis, (2) pyrotherapeutic measures, of which pyrifur treatment, being relatively mild is greatly preferable to malarial therapy, (3) repeated insulin shock-treatment. Insulin has been used at Cery for five years first to treat anorexia, then for psychomotor or katonomic states (on the lines of Klemperer's insulin treatment of delirium tremens), and recently for the production of protracted coma according to Sackel's recommendations. To Steck insulin shock-treatment seems less dangerous and more nearly physiological than treatment by prolonged narcotization by somnifen, dial, etc. Narcotization is not free from the danger of inducing pulmonary complications and much of its effect is due to the psychic contact attained with the patient after his sleep rather than to the sleep itself. In spite of the increasingly good prognosis it must not be forgotten that schizophrenia may be transmitted by those cured to future generations.

Obstetrics and Gynaecology

414 Bilateral Extra uterine Pregnancy

A JESSING (*Hospitalsdende* March 16, 1937, p 307) notes that recurrence of extra uterine pregnancy in the Fallopian tube of a woman previously operated on for extra-uterine pregnancy is such a common event that some gynaecologists have suggested supplementing an operation for extra uterine pregnancy by the removal of the non-pregnant Fallopian tube to prevent this accident. On the other hand, it is most rare to find more than one extra-uterine foetus at one and the same operation. The patient presenting this phenomenon was a married woman aged 42. In June, 1936, she was admitted to hospital suffering from what were taken to be the manifestations of a twisted ovarian tumour or an extra uterine pregnancy with intra abdominal haemorrhage. On laparotomy a right-sided tubal pregnancy with a haematocoele was found, the age of the foetus being between 3 and 4 months. The left uterine appendages formed a tumour which on dissection proved to consist of a 3 to 4 months old foetus and of placental tissue which had become extensively calcified. There was no sign of a recent haemorrhage in this tumour which evidently was the outcome of an interrupted extra uterine pregnancy that had been suspected and treated conservatively two years earlier. Parts of the foetal skeletons could still be identified, although the foetus on the left side was mummified. It is remarkable that with only conservative treatment the patient should have recovered from her first extra uterine pregnancy without the development of an infected haematocoele or of any troublesome adhesions. In 1876 Parry collected 529 cases of extra uterine pregnancy 366 of which terminated fatally. Since the introduction of operative treatment for this condition by Lawson Tait in 1883 the mortality has been reduced to 4 per cent or less.

415 Intra-ovular Injections of Formalin

C A MASSON (*Gynec et Obstet* February 1937 p 115) recalls that Professor A Boero of Buenos Aires has recommended and practised in certain cases the intra amniotic injection of formalin. Interruption of pregnancy was desired on medical grounds but retention for a time of the dead foetus was sought in order to eliminate pregnancy intoxication without immediately exposing the mother to the ordeal and risks of parturition. Masson in a series of animal experiments, has proved that formalin injections in sufficient doses lead to immediate death of the foetuses but to their subsequent retention for several days. His clinical cases include three four to five months pregnancies in consumptives, and one of hyperemesis at

the end of the third month. In the first three the ovum was expelled (*en bloc* in two) with little or no haemorrhage after fifty-four hours, fifty one days, and eight days respectively. In two instances the Friedman pregnancy test was negative three days after the injection. The patient with hyperemesis ceased to vomit after four days, although the small dose of formalin injected had not caused foetal death: a living foetus was born forty five days later. The injections were given through the abdominal wall and were preceded by aspiration of some of the liquor amni.

Pathology

416 Effect of External Temperature on Sedimentation

D B ROSENTHAL (*Med J Austral* January 30, 1937, p 172) points out that the profound influence of the external temperature on the blood sedimentation rate has been largely ignored. He floated tubes in conical flasks maintained at temperatures of 40°, 60°, 80° and 100° F. estimated the sedimentation rate according to Culter's technique, and plotted graphs of the results. He found that the higher the temperature the more rapid the fall within the temperature range indicated. With "slow" blood the difference in the sedimentation index corresponded roughly to the difference in temperature. With "fast" blood the end point a measure of cell volume gave no indication of the effect of temperature on the rate. A mathematical correction for room temperature variation is not yet practicable. Rosenthal emphasizes the need for greater accuracy in recording sedimentation rates, and suggests (1) that a standard temperature of 68° F be used, or, if this is impracticable, that the room temperature be included in the report in order to make provision for variations, (2) that the cell volume be recorded. This can be done by centrifuging the tube or immersing it in a water bath at 100° F and noting the height of the sediment as a percentage of the total height of the blood column. In "fast" blood the sedimentation index is a measure of the cell volume not of the sedimentation velocity and the disparity between the sedimentation index and the cell volume indicates approximately to what extent the former is a measure of the sedimentation velocity. In the absence of any thermometric standards comparison of tests performed at different times on blood from the same source provides no reliable information.

417 Adrenal Insufficiency

S THADDEA and D ALBERS (*Klin Wschr* March 27 1937, p 448) have found thickening of the blood in experimental and clinical adrenal insufficiency. The haemoglobin and the number of erythrocytes were increased the viscosity of the blood was equally increased the sedimentation rate of the red blood corpuscles was slowed while the albumin content of the blood showed no appreciable variation. The administration of the missing suprarenal substances brought the blood more or less to normal. The authors consider that the blood thickening is caused by capillary changes similar to those observed in serous inflammations although there is no question of a true inflammatory reaction.

418 Red Cell Diameters

H MAIER and T SCHUH (*Med Welt* April 3 1937 p 456) have investigated the diameter of the red blood corpuscles in 310 cases of affections of the central nervous system. They found an average diameter of 7.5 microns varying between 6.8 and 8.4 microns. The relation between the diameters of the oval was 2.0. These average measurements can be considered as normal but the maximal measurements were above the normal maximal measurements. The authors are unable to give a satisfactory explanation for these changes.

In the treatment of
PERNICIOUS ANÆMIA
a 1937 achievement
in chemistry

- 1 the purest Liver extract now available
- 2 $\frac{1}{10}$ th its former dry weight.
3. painless on injection
- 4 monthly dry dosage is now similar to the dry dosage of Insulin required by an average diabetic case over the same period

FOR DOUBTFUL CASES, SOLUTIONS OF THE OLD TYPE ARE STILL AVAILABLE ON DEMAND

TWENTY-FIVE per cent. of the flour from which the loaf is produced is wheat germ

Science advocates the use of germ-bread as a factor in promoting nutrition. That is why HOVIS figures so prominently upon the dietary when the question of food value must be studied. In white bread, the wheat-germ is practically non-existent. This vitalising source of protein, fats and phosphates abounds in HOVIS. In fact, twenty-five per cent of the flour from which the HOVIS loaf is produced, is WHEAT-GERM. Apart from its low starch-content, HOVIS is practically free from bran and indigestible cellulose. This factor makes HOVIS supreme for easy digestibility and assimilation.

VITAMIN 'B' CONTENT : HOVIS 2,600 WHOLEMEAL 1,450 WHITE BREAD 200

A Course of Lectures on **PATHOLOGICAL RESEARCH IN ITS RELATION TO
MEDICINE** has been arranged for the **SUMMER SESSION**. These Lectures will
be given in the Lecture Theatre of the Bacteriological Department of the Institute,
on **TUESDAY AFTERNOONS** at 5 p.m. The fourth and fifth lectures of the
series will be the following —

MAY 25th
Prof. EDWARD CHARLES DODDS M.D. D.Sc.
(Director Courtauld Institute of Biochemistry
the Middlesex Hospital)

Subject
Observations on the Structure of Substances
Natural and Synthetic, and their Reactions
on the Body

Syllabus furnished by the Lecturer —

The empirical observations of the older physicians indicated that the physiological processes of the
body could be perceptibly influenced by the application of external agents. Amongst these the most
important were extracts of various types of plants. This led to the development of the science of
pharmacology and provided the organic chemist with some of his most interesting problems, namely
the investigation of the exact structure of the substances present in the plants capable of producing
